

Laplace Transformation I

Why use Laplace Transform?

Algebraic Manipulation of ODE

Solution of ODE is hard.
Transform in to a "domain" where it's easier to solve
Solve in the new domain
Perform "inverse" transform.

Laplace domain is a frequency domain.
Integration, Differentiation becomes multiplication, division.

Laplace Transformation

· Definition: $\mathcal{L} [f(t)] = \int_{0^-}^{\infty} f(t)e^{-st} dt = F(s)$
 $\mathcal{L}: f(t) \Rightarrow F(s), \quad s = \sigma + j\omega$ (complex variable)

$f(t)$: a time function such that $f(t)=0$ for $t < 0$

· Inverse Laplace Transformation

$$\mathcal{L}^{-1}[F(s)] = f(t)$$

Existence of Laplace Transformation

- **f(t) Laplace – transformable**

- if i) **f(t) piecewise–continuous**

- ii) **f(t) of exponential order as t approaches infinity**

- $e^{\alpha t} |f(t)|$ **bounded, α exist.**

- **or $e^{-\sigma t} |f(t)|$ approaches zero as t approaches infinity.**

- **If $\lim_{t \rightarrow \infty} e^{-\sigma t} |f(t)| = \begin{cases} 0 & \text{for } \sigma > \sigma_c \\ \infty & \text{for } \sigma < \sigma_c \end{cases}$**

- the σ_c : **the abscissa of convergence**

Existence of Laplace Transformation

example : 1) $t, \sin \omega t, t \sin \omega t \dots$

$$\lim_{t \rightarrow \infty} e^{-\sigma t} |t \sin \omega t| = \begin{cases} 0 & \text{if } \sigma > 0 \\ \infty & \text{if } \sigma < 0 \end{cases} \quad \text{the abscissa of convergence } \sigma_c = 0$$

2) $e^{-ct}, te^{-ct}, e^{-ct} \sin \omega t, \quad c = \text{const.}$

$$\lim_{t \rightarrow \infty} e^{-\sigma t} |te^{-ct}| = \begin{cases} 0 & \text{if } \sigma > -c \\ \infty & \text{if } \sigma < -c \end{cases} \quad \text{the abscissa of convergence } \sigma_c = -c$$

- e^{t^2}, te^{t^2} does not possess L. T.

- $f(t) = \begin{cases} e^{t^2} & \text{for } 0 \leq t \leq T < \infty \\ 0 & \text{for } t < 0, T < t \end{cases} \quad \text{L}[f(t)] \text{ exists.}$

- The signals that can be physically generated always have corresponding Laplace transforms

Laplace Transformation of simple function

- Exponential function

$$f(t) = \begin{cases} 0 & \text{for } t < 0 \\ Ae^{-\alpha t} & \text{for } t \geq 0 \end{cases}$$

A, α : constants

$$\mathcal{L}[Ae^{-\alpha t}] = \int_{0^-}^{\infty} Ae^{-\alpha t} \cdot e^{-st} dt$$

$$= \int_{0^-}^{\infty} Ae^{-(\alpha+s)t} dt$$

$$= A \left[-\frac{1}{s+\alpha} e^{-(s+\alpha)\cdot\infty} + \frac{1}{s+\alpha} e^0 \right]$$

$$= A \left[-\frac{1}{s+\alpha} e^{-(\sigma+\alpha)\cdot\infty - j\omega\cdot\infty} + \frac{1}{s+\alpha} \right] \quad (s = \sigma + j\omega)$$

$$= A \left[0 + \frac{1}{s+\alpha} \right] = \frac{A}{s+\alpha}$$

Laplace Transformation of simple function

- **step function**

$$f(t) = \begin{cases} A & t > 0 \\ 0 & t < 0 \end{cases}$$

$$\begin{aligned} \mathcal{L}[f(t)] &= \int_{0^-}^{\infty} A e^{-st} dt = A \left[-\frac{1}{s} e^{-s \cdot \infty} + \frac{1}{s} e^{-s \cdot 0} \right] \\ &= A \left[0 + \frac{1}{s} \right] \quad \text{if } \operatorname{Re}[s] > 0 \end{aligned}$$

- **unit step input function**
- $$1(t-t_0) = \begin{cases} 1 & t > t_0 \\ 0 & t < t_0 \end{cases}$$

$$1(t) = \begin{cases} 1 & t > 0 \\ 0 & t < 0 \end{cases}$$

$$\mathcal{L}[1(t)] = \frac{1}{s}$$

Laplace Transformation of simple function

- Sinusoidal Functions

$$f(t) = \begin{cases} A \sin \omega t & t \geq 0 \\ 0 & t < 0 \end{cases}$$

$$\cos \omega t = \frac{1}{2}(e^{j\omega t} + e^{-j\omega t})$$

$$\sin \omega t = \frac{1}{2j}(e^{j\omega t} - e^{-j\omega t})$$

$$\begin{aligned} \mathcal{L}[A \sin \omega t] &= \int_{0^-}^{\infty} \frac{A}{2j} (e^{j\omega t} - e^{-j\omega t}) e^{-st} dt \\ &= \frac{1}{2j} \left(\frac{1}{s - j\omega} - \frac{1}{s + j\omega} \right) \end{aligned}$$

$$= \frac{A\omega}{s^2 + \omega^2}$$

$$\mathcal{L}[A \cos \omega t] = \frac{As}{s^2 + \omega^2}$$

- Ramp function

$$f(t) = \begin{cases} At & t \geq 0 \\ 0 & t < 0 \end{cases}$$

$$\begin{aligned} \mathcal{L}[At] &= A \int_{0^-}^{\infty} t e^{-st} dt \\ &= A \left(t \frac{e^{-st}}{-s} \Big|_{0^-}^{\infty} - \int_{0^-}^{\infty} \frac{e^{-st}}{-s} dt \right) \end{aligned}$$

$$= A \cdot \frac{1}{s} \int_{0^-}^{\infty} e^{-st} dt = A \cdot \frac{1}{s^2}$$

Laplace Transformation of simple function

- Pulse function

$$f(t) = \begin{cases} \frac{A}{t_0} & \text{for } 0 \leq t \leq t_0 \\ 0 & \text{for } t < 0, t_0 < t \end{cases}$$

$$f(t) = \frac{A}{t_0} 1(t) - \frac{A}{t_0} 1(t - t_0)$$

$$\begin{aligned} \mathcal{L}[f(t)] &= \mathcal{L}\left[\frac{A}{t_0} 1(t)\right] - \mathcal{L}\left[\frac{A}{t_0} 1(t - t_0)\right] \\ &= \frac{A}{t_0} \frac{1}{s} (1 - e^{-t_0 s}) \end{aligned}$$

- Impulse function

$$f(t) = \begin{cases} \lim_{t_0 \rightarrow 0} \frac{A}{t_0} & \text{for } 0 \leq t < t_0 \\ 0 & \text{for } t < 0, t_0 < t \end{cases}$$

$$\begin{aligned} \mathcal{L}[f(t)] &= \lim_{t_0 \rightarrow 0} \left[\frac{A}{t_0} \frac{1}{s} (1 - e^{-t_0 s}) \right] \\ &= \lim_{t_0 \rightarrow 0} \frac{\frac{d}{dt_0} [A(1 - e^{-t_0 s})]}{\frac{d}{dt_0} (t_0 s)} = \frac{A \cdot s}{s} = A \end{aligned}$$

Laplace Transformation of simple function

- Unit impulse function ; impulse function of magnitude 1

$$f(t) = \begin{cases} \lim_{t_0 \rightarrow 0} \frac{1}{t_0} & \text{for } 0 \leq t < t_0 \\ 0 & \text{for } t < 0, t_0 < t \end{cases}$$

$$\delta(t) = \begin{cases} \infty & t = 0 \\ 0 & t \neq 0 \end{cases} \quad \mathcal{L}[\delta(t)] = \int_0^{\infty} \delta(t) e^{-st} dt = \int_{0^-}^{0^+} \delta(t) dt = 1$$

The unit-impulse function occurring at $t = t_0$

$$\delta(t) = \begin{cases} \infty & t = t_0 \\ 0 & t \neq t_0 \end{cases} \quad \mathcal{L}[\delta(t-t_0)] = \int_0^{\infty} \delta(t-t_0) e^{-st} dt = \int_{t_0^-}^{t_0^+} \delta(t-t_0) e^{-st_0} dt = e^{-t_0 s} \cdot 1$$

$$\delta(t-t_0) = \frac{d}{dt} 1(t-t_0)$$
