Optimum x

Augmented Lagrange Multiplier Method in Equality Constrained Problem (4/4) Minimize  $f(\mathbf{x})$ **Subject to**  $h_i(\mathbf{x}) = \mathbf{0}, \quad j = 1, 2, ..., m$ Augmented Lagrangian function  $\Phi(\mathbf{x}, \boldsymbol{\lambda}, r_k) = f(\mathbf{x}) + \sum_{j=1}^m \lambda_j h_j(\mathbf{x}) + r_k \sum_{j=1}^m h_j^2(\mathbf{x})$ Augmented term to Lagrangian function  $r_k$  : arbitrary constant Iterative relation  $\lambda_i^{(k+1)} = \lambda_i^{(k)} + 2r_k h_i(\mathbf{x}^{(k)}) \quad j = 1, 2, ..., m$ ..... 3. The values of  $\lambda_j^{(k)}$  and  $r_k$  are then updated by using the iterative relation to start the next iteration.  $r_{k+1} = cr_k, c > 1$  $\lambda_j^{(k+1)} = \lambda_j^{(k)} + 2r_k h_j(\mathbf{x}^{*(k)}) \quad j = 1, 2, ..., m$ 4. If  $\left|\lambda_{j}^{(k+1)} - \lambda_{j}^{(k)}\right| < \varepsilon$ , stop the iteration and take  $\mathbf{x}^{*} = \mathbf{x}^{*(k)}$ . sydlab 20 utomation, Fall 2015, Myung-II
