Phase Diagrams of Binary Sys.

① Date .

10.2. Free E. and activity.

$$\Delta G^m = RT(X_A \ln a_A + X_B \ln a_B)$$

↳ the diff. bet'n the f.E. of a mole of homo. sol'n and the f.E

if it is ideal $\Delta G^{m,id} = RT(X_A \ln X_A + X_B \ln X_B)$.

As $\Delta H^{m,id} = 0$ $\Delta G^{m,id} = -T\Delta S^{m,id}$

∴ the shape of the curve of $\Delta G^{m,id}$ = only $f(T)$.

$\gamma_i < 1, \; a_i < X_i$ normal

$\bar{\Delta G_B^m} = RT \ln a_B$.

$\gamma_{I,B} > 1 > \gamma_{III,B}$.

∴ ΔG^m - comp ~ activity

10.3. The F.E. of Regular Sol'n.

i) Regular sol'n 에서 α가 ΔG^m curve 에 미치는 영향.

✓ Gen'l term   if $G^{xs} = \Delta H^m$ only ≠ $f(T)$.

$$\Delta G^{m,id} - \Delta G^{m,id} + G^{xs} = + RT\alpha X_A X_B = + \Delta H^m = \Omega$$

For curve I, $|\Delta G^m| < |\Delta G^{m,id}|$,   then $\Delta H^m > 0$ ∴ $\alpha > 0$.

for curve III, $|\Delta G^m| > |\Delta G^{m,id}|$ then $\Delta H^m < 0$ ∴ $\alpha < 0$.

Fig 10.3   Change in $\Delta G^m / RT$ as $\alpha \uparrow$.

— As $\alpha \uparrow$, the shape of the curve changes.

① for. equil^m betw ℓ & S. phase

(10.7) $\Delta \bar{G}_A^n$ (in s.s) $= \Delta \bar{G}_A^n$ (in ℓ.s) $\Delta \bar{G}_A^n = \Delta G_A^n + X_B \frac{\partial}{\partial}$

(10.8) $\Delta \bar{G}_B^n$ (in s.s) $= \Delta \bar{G}_B^n$ (in ℓ.s)

$\rightarrow$ At any T. $\rightarrow$ these fixe the solidus, liquidus compositions.

from (n.5) $\left(\frac{\partial G_{(\ell)}^n}{\partial X_{A(\ell)}} = RT[\ln X_{A(\ell)} - \ln X_{B(\ell)}] - \Delta G_m^\circ$ (B) $\right.$

(10.9) $\longrightarrow X_{B(\ell)} \times$ $X_{B(\ell)} \times$ $X_{B(\ell)} \times$

(11.33a) $\Delta \bar{G}_A^n$ (in ℓ.s) $= \Delta G_{(\ell)}^n + X_{B(\ell)} \frac{\partial \Delta G_{(\ell)}^n}{\partial X_{A(\ell)}}$

              $\Delta \bar{G}_A^n$ (in s.s) $= RT \ln X_{A(s)} - \Delta G_m^\circ$ (10.12)

from (10.5) & (10.8) $\boxed{\Delta \bar{G}_A^n \text{ (in } \ell.s) = RT \ln X_{A(\ell)}}$!   (10.10)

(10.6) + (10.11)   Similarly $\Delta \bar{G}_B^n$ (in s.s) $= RT \ln X_{B(s)}$ (10.15)

and iii) Find X_S & X_L $\Delta \bar{G}_A^H (in\ l.s) = \Delta \bar{G}_A^H (in\ s.s)$ (10.7)

$$\Delta \bar{G}_B^M \text{ (in the liquid solution)} = \Delta \bar{G}_B^M \text{ (in the solid solution)} \qquad (10.8)$$

At "any" temperature T, these two conditions fix the solidus and liquidus compositions, i.e., the position of the points of double tangency. From Eq. (10.5)

i) $\Delta G_{B(l.s)}^H$ oil chain Δ

$$\frac{\partial \Delta G_{(l)}^M}{\partial X_{A(l)}} = RT\,(\ln X_{A(l)} - \ln X_{B(l)}) - \Delta G_{m(B)}^\circ$$

Thus $(\times X_B)$

$$X_{B(l)} \frac{\partial \Delta G_{(l)}^M}{\partial X_{A(l)}} = RT(X_{B(l)} \ln X_{A(l)} - X_{B(l)} \ln X_{B(l)}) - X_{B(l)} \Delta G_{m(B)}^\circ \qquad (10.9)$$

From Eq. (9.33a) $\Delta G_l^H = RT(X_A \ln X_A + X_B \ln X_B) + X_B \Delta G_{m(B)}^\circ$

$$\Delta \bar{G}_A^M \text{ (in liquid solutions)} = \Delta G_{(l)}^M + X_{B(l)} \frac{\partial \Delta G_{(l)}^M}{\partial X_{A(l)}}$$

and thus, adding Eq. (10.5) and (10.9) gives

$$\Delta \bar{G}_A^M \text{ (in liquid solutions)} = RT \ln X_{A(l)} \qquad (10.10)$$

From Eq. (10.6)

ii) $\Delta G_{B(s.s)}^H$ oil 제2H $\frac{\partial \Delta G_{(s)}^M}{\partial X_{A(s)}} = RT\,(\ln X_{A(s)} - \ln X_{B(s)}) - \Delta G_{m(A)}^\circ$

and thus

$$X_{B(s)} \frac{\partial \Delta G_{(s)}^M}{\partial X_{A(s)}} = RT(X_{B(s)} \ln X_{A(s)} - X_{B(s)} \ln X_{B(s)}) - X_{B(s)} \Delta G_{m(A)}^\circ \qquad (10.11)$$

Adding Eqs. (10.6) and (10.11) gives $\Delta G_{(s)}^H = RT(X_A \ln X_A + X_B \ln X_B) - X_A \Delta G_{m(A)}^\circ$

$$\Delta \bar{G}_A^M \text{ (in solid solutions)} = \Delta G_{(s)}^M + X_{B(s)} \frac{\partial \Delta G_{(s)}^M}{\partial X_{A(s)}} = RT \ln X_{A(s)} - \Delta G_{m(A)}^\circ \qquad (10.12)$$

Thus, from Eqs. (10.7), (10.10), and (10.12)

$$\boxed{RT \ln X_{A(l)} = RT \ln X_{A(s)} - \Delta G_{m(A)}^\circ} \qquad (10.13)$$

Similarly, from Eqs. (10.5) and (9.33b)

$$\Delta \bar{G}_B^M \text{ (in liquid solutions)} = \Delta G_{(l)}^M + X_{A(l)} \frac{\partial \Delta G_{(l)}^M}{\partial X_{B(l)}} = RT \ln X_{B(l)} + \Delta G_{m(B)}^\circ \qquad (10.14)$$

and from Eqs. (10.6) and (9.33b)

$$\Delta \bar{G}_B^M \text{ (in solid solutions)} = \Delta G_{(s)}^M + X_{A(s)} \frac{\partial \Delta G_{(s)}}{\partial X_{B(s)}} = RT \ln X_{B(s)} \qquad (10.15)$$

Thus, from Eqs. (10.8), (10.14), and (10.15),

$$\boxed{RT \ln X_{B(l)} + \Delta G^{\circ}_{m(B)} = RT \ln X_{B(s)}} \qquad (10.16)$$

The solidus and liquidus compositions are thus determined by Eqs. (10.13) and (10.16) as follows. Eq. (10.13) can be written as

Finally ①
$$X_{A(l)} = X_{A(s)} \exp\left(\frac{-\Delta G^{\circ}_{m(A)}}{RT}\right) \qquad (10.17)$$

and, noting that $X_B = 1 - X_A$, Eq. (10.16) can be written as

②
$$(1 - X_{A(l)}) = (1 - X_{A(s)}) \exp\left(\frac{-\Delta G^{\circ}_{m(B)}}{RT}\right) \qquad (10.18)$$

Combination of Eqs (10.17) and (10.18) gives

①′
$$X_{A(s)} = \frac{1 - \exp(-\Delta G^{\circ}_{m(B)}/RT)}{\exp(-\Delta G^{\circ}_{m(A)}/RT) - \exp(-\Delta G^{\circ}_{m(B)}/RT)} \qquad (10.19)$$

and

②′
$$X_{A(l)} = \frac{[1 - \exp(-\Delta G^{\circ}_{m(B)}/RT)]\exp(-\Delta G^{\circ}_{m(A)}/RT)}{\exp(-\Delta G^{\circ}_{m(A)}/RT) - \exp(-\Delta G^{\circ}_{m(B)}/RT)} \qquad (10.20)$$

Thus, if $c_{p,i(s)} = c_{p,i(l)}$, in which case

$$\Delta G^{\circ}_{m(i)} = \Delta H^{\circ}_{m(i)} \times \left[\frac{T_{m(i)} - T}{T_{m(i)}}\right] \qquad (10.4)$$

it is seen that the phase diagram for a system which forms ideal solid and liquid solutions is determined only by the melting temperatures and the molar heats of melting of the components.

Example

The system Ge–Si exhibits complete ranges of liquid and solid solutions. (1) Calculate the phase diagram for the system assuming that the solid and liquid solutions are Raoultian in their behavior and (2) calculate the temperature at which the liquidus (and hence solidus) composition exerts its maximum vapor pressure.

Silicon melts at 1685 K, and its standard Gibbs free energy change on melting is

$$\Delta G^{\circ}_{m,Si} = 50{,}200 - 29.8\,T \text{ J}$$

The saturated vapor pressure of solid Si is

$$\log p^{\circ}_{Si(s)} \text{ (atm)} = -\frac{23{,}550}{T} - 0.565 \log T + 9.47$$

Germanium melts at 1213 K and its standard Gibbs free energy change on melting is

$$\Delta G^{\circ}_{m,Ge} = 36{,}800 - 30.3\,T \text{ J}$$

$$\delta G_i^? = \Delta_j + RT \ln X_{i(\ell)}$$

$from\ (12.7)(12-13\ to\ )(12.14)$

(10.13)

$$RT \ln X_{A(\ell)} = RT \ln X_{A(s)} - \Delta G^o_{m(A)}$$

(10.16) Similarly

$$RT \ln X_{B(\ell)} + \Delta G^o_{m(B)} = RT \ln X_{B(s)}$$
