Dispersion in SMF

□ Types of Dispersion

- Chromatic dispersion

Material dispersion

Waveguide dispersion: usually *smaller* than material dispersion

Short wavelength: The effective index is close to n_{core} .

Long wavelength: The effective index is close to $n_{cladding}$.

- Modal dispersion

Pulse spreading in a multimode fiber

Dispersion is a problem in fiber communications: It limits the *bandwidth* of the fiber.

Material dispersion

White light that is a mixture of colors can be separated into different wavelengths.

Refractive index n is inherently a function of wavelength.

Recall Snell's law!

$$n_i \sin \theta_i = n_t \sin \theta_t$$

■ Natural Dispersion RAINBOW

Material dispersion

e.g. Sellmeier equation:

$$n^2(\omega) = 1 + \sum_{j=1}^m \frac{B_j \omega_j^2}{\omega_j^2 - \omega^2}$$

The origin of chromatic dispersion is related to the characteristic resonance frequencies at which the medium absorbs the electromagnetic radiation through oscillations of bound electrons.

→ Kramers-Kronig relations:

$$\varepsilon(\omega) = \varepsilon_r(\omega) + i\varepsilon_i(\omega)$$

The real and imaginary parts are related to each other.

(cf. Driven harmonic oscillator)

See also Classical Electrodynamics, J. D. Jackson

Dispersion relation

Mode-propagation constant β in a Taylor series:

$$\beta(\omega) = n(\omega) \frac{\omega}{c} = \beta_0 + \beta_1(\omega - \omega_0) + \frac{1}{2} \beta_2(\omega - \omega_0)^2 + \dots,$$

$$\text{where } \beta_m = \left(\frac{d^m \beta}{d\omega^m} \right)_{\omega=\omega_0} \quad (m = 1, 2, 3, \dots)$$

$$\beta_1 = \frac{1}{v_g} = \frac{n_g}{c} = \frac{1}{c} \left(n + \omega \frac{dn}{d\omega} \right), \quad \rightarrow \text{Group velocity}$$

$$\beta_2 = \frac{1}{c} \left(2 \frac{dn}{d\omega} + \omega \frac{d^2 n}{d\omega^2} \right), \quad \rightarrow \text{Group velocity dispersion}$$

$$\psi(z, t) = \int_{-\infty}^{\infty} A(\omega) e^{i(\omega t - \beta(\omega)z)} d\omega \quad \leftarrow \text{Wave packet}$$

Waveguide dispersion

The effective mode index is slightly lower than the material index $n(\omega)$ of the core, which is also wavelength dependent.

Single-mode fiber (SMF)

Dispersion-compensation Fiber (DCF)

Dispersion in SMF

Source: Nonlinear Fiber Optics, G. P. Agrawal

Dispersion parameter:

$$D = \frac{d\beta_1}{d\lambda} = -\frac{2\pi c}{\lambda^2} \beta_2 \approx \frac{\lambda}{c} \frac{d^2 n}{d\lambda^2}$$

Normal dispersion: $\beta_2 > 0$ or $D < 0$
 High-freq. components *slower* than
 low-freq. components

Anomalous dispersion: $\beta_2 < 0$ or $D > 0$
 High-freq. components *faster* than
 low-freq. components

Walk-off in SMF

Source: Nonlinear Fiber Optics, G. P. Agrawal

Walk-off parameter:

$$d_{12} = \beta_1(\lambda_1) - \beta_2(\lambda_2) = \frac{1}{v_g(\lambda_1)} - \frac{1}{v_g(\lambda_2)}$$

Walk-off length:

$$L_W = \frac{T_0}{|d_{12}|}$$

e.g. $\lambda_1 = 532 \text{ nm}$, $\lambda_2 = 1064 \text{ nm}$

$$d_{12} \approx 80 \text{ ps/m}$$

$$L_W = 25 \text{ cm for } T_0 = 20 \text{ ps}$$

Polarisation-mode dispersion (PMD)

Fibre details

Fibre details: hi-bi Yb-doped fibre with borosilicate stress rods
Core 25 μm , NA <0.06, OD 380 μm
Birefringence $\sim 2 \times 10^{-4}$
(cf. SMF: $\sim 10^{-8}$)

PANDA

Excellent optical properties. Excellent uniformity over length

Elliptical Core

Rudimentary optical properties

Elliptical Clad

Reasonable optical properties. Poor uniformity over length

Bow-Tie

Reasonable optical properties. Poor uniformity over length

Source: www.nufem.com

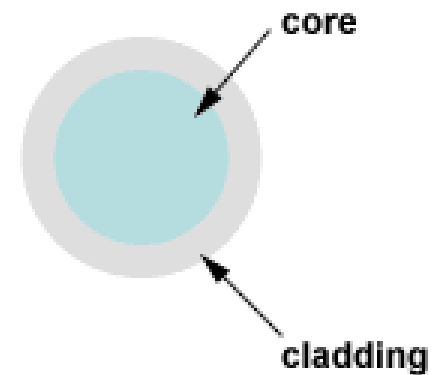

Birefringence:

$$B_m = \frac{|\beta_x - \beta_y|}{k_0} = |n_x - n_y|$$

Beat length:

$$L_B = \frac{2\pi}{|\beta_x - \beta_y|} = \frac{\lambda}{B_m}$$

Modal dispersion

Source: www.fiberoptics4sale.com

Optical path differences among modes → different group velocity.

$$v_{g,m} = \frac{d\omega}{d\beta_m}$$

Data Transmission over SMF

■ Initial Optical Pulses (10 Gbps, 0 dBm)

■ After 50-km Transmission

■ Group velocity dispersion (GVD)

⇒ Frequency chirp

■ Nonlinear effect

⇒ Four-wave mixing (FWM)

■ Power Spectrum
