# 5. Energy Bands in Crystals

## 5.1 One-Dimensional Zone Schemes

Energy  $E$  vs momentum of the electrons  $p$  (or  $k$ )

For free electrons, the wave number in 1-dim

$$E = \frac{\hbar^2}{2m} k^2 \quad \longrightarrow \quad k_x = \text{const.} E^{1/2}$$

In a crystal

$$P \frac{\sin \alpha a}{\alpha a} + \cos \alpha a = \cos ka \quad \text{If } P = 0, \quad \cos \alpha a = \cos ka$$

$$\cos \alpha a = \cos k_x a \equiv \cos(k_x a + n2\pi) \quad : \text{ more general form in 1-dim}$$

$$n = 0, \pm 1, \pm 2, \dots \quad \alpha a = k_x a + n2\pi \quad \left. \vphantom{\alpha a = k_x a + n2\pi} \right\} \quad k_x + n \frac{2\pi}{a} = \sqrt{\frac{2m}{\hbar^2}} E^{1/2}$$

Combining with  $\alpha = \sqrt{\frac{2m}{\hbar^2}} E^{1/2}$

Figure 5.1. Electron energy  $E$  versus the wave vector  $k_x$  for free electrons.

# 5. Energy Bands in Crystals

## 5.1 One-Dimensional Zone Schemes

$$k_x + n \frac{2\pi}{a} = \sqrt{\frac{2m}{\hbar^2}} E^{1/2}$$

$E$  is a periodic function of  $k_x$  with the periodicity of  $2\pi/a$

Figure 5.2. Periodic repetition of Fig. 5.1 at the points  $k_x = n \cdot 2\pi/a$ . The figure depicts a family of free electron parabolas having a periodicity of  $\pm 2\pi/a$ .

If an electron propagates in *a periodic potential*, discontinuities of the electron energies are observed when  $\cos k_x a$  has a maximum or a minimum, i.e., when  $\cos k_x a = \pm 1$

$$k_x a = n\pi, \quad n = \pm 1, \pm 2, \pm 3, \dots, \quad \text{or} \quad k_x = n \cdot \frac{\pi}{a}$$

At these singularities, a deviation from the parabolic  $E$  vs  $k_x$  occurs and the branches of the individual parabolas merge into the neighboring ones (see Fig.5.3)

# 5. Energy Bands in Crystals

## 5.1 One-Dimensional Zone Schemes

Figure 5.3. Periodic zone scheme.

The electrons in a crystal behave like free electrons for most  $k_x$  value except  $k_x \rightarrow n \pi/a$

**periodic zone scheme** (see Fig 5.3)

**reduced zone scheme** (see Fig 5.4)

$$\pi/a \leq k_x \leq \pi/a$$

Figure 5.4. Reduced zone scheme. (This is a section of Fig. 5.3 between  $-\pi/a$  and  $+\pi/a$ .)

# 5. Energy Bands in Crystals

## 5.1 One-Dimensional Zone Schemes

Figure 5.5. Extended zone scheme. The first and second Brillouin zones (BZ) are shown, see Section 5.2.

**extended zone scheme** (see Fig 5.5)

the deviations from the free electron parabola at the critical points  $k_x = n\pi/a$  are particularly easy to identify.

Figure 5.6. “Free electron bands” plotted in the reduced zone scheme (cubic primitive crystal structure). Compare this figure with the central portion of Fig. 5.2, that is, with the region from zero to  $\pi/a$ . Note the sameness of the individual bands.

**free electron bands** (see Fig 5.6)

free electrons in a reduced zone scheme

$$\text{from } k_x + n \frac{2\pi}{a} = \sqrt{\frac{2m}{\hbar^2}} E^{1/2}$$

$$E = \frac{\hbar^2}{2m} \left( k_x + n \frac{2\pi}{a} \right)^2, \quad n = \pm 0, \pm 1, \pm 2, \dots$$

# 5. Energy Bands in Crystals

## 5.1 One-Dimensional Zone Schemes

$$E = \frac{\hbar^2}{2m} \left( k_x + n \frac{2\pi}{a} \right)^2, \quad n = \pm 0, \pm 1, \pm 2, \dots$$

By inserting different  $n$ -values, one can calculate the shape of branches of the free electron bands

$$n = 0, \quad E = \frac{\hbar^2}{2m} k_x^2 \quad (\text{parabola with } 0 \text{ as origin})$$

$$n = -1, \quad E = \frac{\hbar^2}{2m} \left( k_x - \frac{2\pi}{a} \right)^2 \quad (\text{parabola with } \frac{2\pi}{a} \text{ as origin})$$

$$\text{For } k_x = 0, \quad E = 4 \frac{\pi^2 \hbar^2}{2ma^2}$$

$$\text{For } k_x = \frac{\pi}{a}, \quad E = 1 \frac{\pi^2 \hbar^2}{2ma^2}$$

# 5. Energy Bands in Crystals

## 5.2 One- and Two-Dimensional Brillouin Zones

### 1-d Brillouin Zone

- **The first Brillouin Zone (BZ) :**

$$\pi/a \leq k_x \leq \pi/a : \text{n-Band}$$

- **The second Brillouin Zone (BZ):**

$$\pi/a \leq k_x \leq 2\pi/a, -\pi/a \leq k_x \leq -2\pi/a : \text{m-band}$$

- Individual branches in an extended zone scheme (Fig. 5.5) can be shifted by  $2\pi/a$  to left or to right.

Shift the branches of 2<sup>nd</sup> BZ to the positive side of  $E-k_x$  diagram by  $2\pi/a$  to the left, and likewise the left band by  $2\pi/a$  to the right → The result is shown in Fig. 5.4 (a reduced zone scheme)

- The same can be done in 3<sup>rd</sup> BZ, and all BZ (because of the  $2\pi/a$  periodicity) → relevant information of all BZ can be contained in the 1<sup>st</sup> BZ (a reduced zone scheme)

# 5. Energy Bands in Crystals

## 5.2 One- and Two-Dimensional Brillouin Zones

### 2-d Brillouin Zone

Description for the movement of an electron in the potential of 2-d lattice

- Wave vector  $\mathbf{k} = (k_x, k_y)$  : 2-d reciprocal lattice (Fig 5.7)
- A 2-d field of allowed energy regions which correspond to the allowed energy band  $\rightarrow$  2-d BZ
- 1st zone in 2-d: the area enclosed by four “Bragg planes” having four shortest lattice vectors,  $\mathbf{G}_1$ : bisectors on the lattice vectors
- For the following zone  $\rightarrow$  construct the bisectors of the next shortest lattice vectors,  $\mathbf{G}_2, \mathbf{G}_3 \dots$
- For the zone of higher order the extended limiting lines of the zones of lower order are used as additional limiting lines.

Figure 5.7. Four shortest lattice vectors in a  $k_x - k_y$  coordinate system and the first Brillouin zone in a two-dimensional reciprocal lattice. (Cubic primitive crystal structure.)

# 5. Energy Bands in Crystals

## 5.2 One- and Two-Dimensional Brillouin Zones

The first four BZ shown in Fig 5.8

“Usefulness of BZ”

- energy bands of solids (discussed in later section)
- the behavior of electrons which travel in a specific direction in reciprocal space

Example: in 2-d lattice, an electron travels at 45° to  $k_x$ -axis, then the boundary of the BZ is reached,

according to Fig 5.8, for  $k_{crit} = \frac{\pi}{a} \sqrt{2}$

this yields with (4.8) a maximal attainable energy of  $E_{max} = \frac{\pi^2 \hbar^2}{a^2 m}$

If the boundary of a BZ is reached at  $k_{crit} = \frac{\pi}{a}$

the largest energy of electrons moving parallel to  $k_x$  or  $k_y$  axis  $E_{max} = \frac{1}{2} \left( \frac{\pi^2 \hbar^2}{a^2 m} \right)$

Figure 5.8. The first four Brillouin zones of a two-dimensional, cubic primitive reciprocal lattice.

# 5. Energy Bands in Crystals

## 5.2 One- and Two-Dimensional Brillouin Zones

- Once the maximal energy has been reached, the electron waves (those of the incident and the Bragg-reflected electrons) form standing waves (the electrons are reflected back into the BZ.)
- Overlapping of energy bands: bands are drawn in different directions in  $k$ -space (Fig 5.9) :  
the consequence of

$$k_{crit} = \frac{\pi}{a} \quad \text{and} \quad k_{crit} = \frac{\pi}{a} \sqrt{2}$$

Figure 5.9. Overlapping of allowed energy bands.

# 5. Energy Bands in Crystals

## 5.2 One- and Two-Dimensional Brillouin Zones

A different illustration of the occurrence of critical energies at which a reflection of the electron wave takes place :

### Bragg relation

$$2a \sin \theta = n\lambda, \quad n = 1, 2, 3, \dots$$

Since  $\lambda = 2\pi/k$

$$2a \sin \theta = n \frac{2\pi}{k} \longrightarrow k_{crit} = n \frac{\pi}{a \sin \theta}$$

For a perpendicular incidence,  $\theta = 90^\circ$ ,  $k_{crit} = \frac{\pi}{a}$

If  $\theta = 45^\circ$ ,  $k_{crit} = \frac{\pi}{a} \sqrt{2}$

For increasing electron energies, a critical  $k$ -value is finally reached for which “reflection” of the electron wave at the lattice plane occurs. At  $k_{crit}$ , the transmission of electron beam through the lattice is prevented.

Figure 5.10. Bragg reflection of an electron wave in a lattice. The angle of incidence is  $\theta$ .

# 5. Energy Bands in Crystals

## 5.3 Three-Dimensional Brillouin Zones

- In previous section, it was shown that at the boundaries of the zones the electron waves are Bragg-reflected by the crystal.
- The wave vector,  $|\mathbf{k}| = 2\pi/\lambda$ , was seen to have the unit of reciprocal length and thus is defined in the reciprocal lattice.
- The construction of 3-d Brillouin zones for two important crystal structures of face centered cubic (FCC) and body centered cubic (BCC) : important features in common with “**Wigner- Seitz cells**”

# 5. Energy Bands in Crystals

## 5.4 Wigner - Seitz Cells

Crystals have symmetrical properties

- An accumulation of “**unit cell**”
- Smallest possible cell “**primitive cell**”  
(consist of 1 atom)
- BCC, FCC : conventional non-primitive unit cells

- **Wigner-Seitz cell** : a special type of primitive unit cell that shows the cubic symmetry of cubic cells

- W-S cell construction: bisects the vectors from a given atom to its nearest neighbors and place a plane perpendicular to these vectors at the bisecting points. For BCC (Fig 5.11) & FCC (Fig. 5. 13)

Figure 5.11. Wigner–Seitz cell for the body-centered cubic (bcc) structure.

# 5. Energy Bands in Crystals

## 5.4 Wigner - Seitz Cells

- The atomic arrangement of FCC: corners and faces of cube, or center points of the edges and the center of the cell (Fig 5.12)
- The W-S cell for FCC shown in Fig 5.13

Figure 5.12. Conventional unit cell of the fcc structure. In the cell which is marked black, the atoms are situated on the corners and faces of the cubes. In the white cell, the atoms are at the centers of the edges and the center of the cell.

Figure 5.13. Wigner-Seitz cell for the fcc structure. It is constructed from the white cell which is marked in Fig. 5.12.

# 5. Energy Bands in Crystals

## 5.5 Translation Vectors and the Reciprocal Lattice

Fundamental vectors or primitive vectors :  $\mathbf{t}_1, \mathbf{t}_2, \mathbf{t}_3$

Translation vectors,  $\mathbf{R}$  : combination of primitive vectors

$$\mathbf{R} = n_1 \mathbf{t}_1 + n_2 \mathbf{t}_2 + n_3 \mathbf{t}_3$$

where  $n_1, n_2,$  and  $n_3$  are integers.

Three vectors for the reciprocal lattice:  $\mathbf{b}_1, \mathbf{b}_2, \mathbf{b}_3$

a translation vector for the reciprocal lattice,  $\mathbf{G}$

$$\mathbf{G} = 2\pi(h_1 \mathbf{b}_1 + h_2 \mathbf{b}_2 + h_3 \mathbf{b}_3)$$

where  $h_1, h_2,$  and  $h_3$  is integer

$$\mathbf{t}_1 = \frac{a}{2}(-\mathbf{i} + \mathbf{j} + \mathbf{l})$$

Figure 5.14. (a) Fundamental lattice vectors  $\mathbf{t}_1, \mathbf{t}_2, \mathbf{t}_3$  in a cubic primitive lattice. (b) Fundamental lattice vectors in a conventional (white) and primitive, noncubic unit cell (black) of a bcc lattice. The axes of the primitive (noncubic) unit cell form angles of  $109^\circ 28'$ .

# 5. Energy Bands in Crystals

## 5.5 Translation Vectors and the Reciprocal Lattice

The relation between real and reciprocal lattices

By definition,

$$\mathbf{b}_1 \bullet \mathbf{t}_1 = 1, \quad \text{Kronecker-Delta symbol}$$

$$\left. \begin{aligned} \mathbf{b}_1 \bullet \mathbf{t}_2 &= 0, \\ \mathbf{b}_1 \bullet \mathbf{t}_3 &= 0. \end{aligned} \right\} \mathbf{b}_n \mathbf{t}_m = \delta_{nm},$$

where  $\delta_{nm} = 1$  for  $n = m$  and  $\delta_{nm} = 0$  for  $n \neq m$

Figure 5.15. Plane formed by  $\mathbf{t}_2$  and  $\mathbf{t}_3$  with perpendicular vector  $\mathbf{b}_1$ .

$$\mathbf{b}_1 = \text{const. } \mathbf{t}_2 \times \mathbf{t}_3 \longrightarrow \mathbf{b}_1 \bullet \mathbf{t}_1 = \text{const. } \mathbf{t}_1 \bullet \mathbf{t}_2 \times \mathbf{t}_3 = 1 \longrightarrow \text{const} = \frac{1}{\mathbf{t}_1 \bullet \mathbf{t}_2 \times \mathbf{t}_3}$$

$$\mathbf{b}_1 = \frac{\mathbf{t}_2 \times \mathbf{t}_3}{\mathbf{t}_1 \bullet \mathbf{t}_2 \times \mathbf{t}_3}$$

$$\mathbf{b}_2 = \frac{\mathbf{t}_3 \times \mathbf{t}_1}{\mathbf{t}_1 \bullet \mathbf{t}_2 \times \mathbf{t}_3}$$

$$\mathbf{b}_3 = \frac{\mathbf{t}_1 \times \mathbf{t}_2}{\mathbf{t}_1 \bullet \mathbf{t}_2 \times \mathbf{t}_3}$$

# 5. Energy Bands in Crystals

## 5.5 Translation Vectors and the Reciprocal Lattice

Calculation for the reciprocal lattice of a BCC crystal

### Real crystal

$a$ : lattice constant,  $\mathbf{t}_1, \mathbf{t}_2, \mathbf{t}_3$ : primitive lattice vectors,

$\mathbf{i}, \mathbf{j}, \mathbf{l}$ : unit vectors in the  $x, y, z$  coordinate system (see Fig. 5.14(b))

$$\mathbf{t}_1 = \frac{a}{2}(-\mathbf{i} + \mathbf{j} + \mathbf{l})$$

Abbreviated,  $\mathbf{t}_1 = \frac{a}{2}(\bar{1} 1 1) \quad \mathbf{t}_2 = \frac{a}{2}(1 \bar{1} 1) \quad \mathbf{t}_3 = \frac{a}{2}(1 1 \bar{1})$

$$\mathbf{t}_2 \times \mathbf{t}_3 = \frac{a^2}{4} \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & -1 & 1 \\ 1 & 1 & -1 \end{vmatrix} = \frac{a^2}{4} (\mathbf{i} + \mathbf{j} + \mathbf{l} + \mathbf{l} - \mathbf{i} + \mathbf{j})$$

$$= \frac{a^2}{4} (2\mathbf{j} + 2\mathbf{l}) = \frac{a^2}{2} (\mathbf{j} + \mathbf{l})$$

Figure 5.16. Lattice vectors in reciprocal space of a bcc crystal. The primitive vectors in the reciprocal lattice are (because of (5.13)) larger by a factor of  $2\pi$ . The lattice constant of the cube then becomes  $2\pi \cdot 2/a$ .

# 5. Energy Bands in Crystals

## 5.5 Translation Vectors and the Reciprocal Lattice

(continued)

$$\mathbf{t}_1 \bullet \mathbf{t}_2 \times \mathbf{t}_3 = \frac{a^3}{4} (-\mathbf{i} + \mathbf{j} + \mathbf{l}) \bullet (0 + \mathbf{j} + \mathbf{l}) = \frac{a^3}{4} (0 + 1 + 1) = \frac{a^3}{2}$$

$$\mathbf{b}_1 = \frac{\mathbf{t}_2 \times \mathbf{t}_3}{\mathbf{t}_1 \bullet \mathbf{t}_2 \times \mathbf{t}_3} \longrightarrow \mathbf{b}_1 = \frac{\frac{a^2}{2} (\mathbf{j} + \mathbf{l})}{\frac{a^3}{2}} = \frac{1}{a} (\mathbf{j} + \mathbf{l}),$$

$$\mathbf{b}_1 = \frac{1}{a} (011) \quad \mathbf{b}_2 = \frac{1}{a} (101) \quad \mathbf{b}_3 = \frac{1}{a} (110)$$

# 5. Energy Bands in Crystals

## 5.6 Free electron Bands

Periodicity of  $E(\mathbf{k}) \rightarrow$  all information of electron contained in the 1st Brillouin Zone (BZ)

$E_{\mathbf{k}'}$ , for  $\mathbf{k}'$  for outside 1<sup>st</sup> BZ  $\rightarrow E_{\mathbf{k}}$  with in 1<sup>st</sup> BZ with a suitable translation vector  $\mathbf{G}$

$$\mathbf{k}' = \mathbf{k} + \mathbf{G}$$

“Energy bands are not alike in different directions in  $\mathbf{k}$ -space”

for the demonstration, “free electron band” is used (Fig 5.6 ).

In 3-D, from (5.7)  $E_{\mathbf{k}'} = \frac{\hbar^2}{2m} (\mathbf{k} + \mathbf{G})^2$

$$E = \frac{\hbar^2}{2m} \left( k_x + n \frac{2\pi}{a} \right)^2, \quad n = \pm 0, \pm 1, \pm 2, \dots \quad (5.7)$$

# 5. Energy Bands in Crystals

## 5.6 Free electron Bands

In Fig 5.17, three important directions

[100] from  $\Gamma$ (origin) to point  $H$ :  $\Delta$

[110] from  $\Gamma$  to  $N$ :  $\Sigma$

[111] from  $\Gamma$  to  $P$ :  $\Lambda$

Figure 5.17. First Brillouin zone of the bcc crystal structure.

Fig 5.18 calculated by using the following equation

$$E_{k'} = \frac{\hbar^2}{2m} (\mathbf{k} + \mathbf{G})^2$$

Figure 5.18. Energy bands of the free electrons for the bcc structure. The numbers given on the branches are the respective  $h_l$  values (see the calculation in the text). Compare to Fig. 5.6.  $C = \hbar^2 2\pi^2 / ma^2$ , see (5.38).

# 5. Energy Bands in Crystals

## 5.6 Free electron Bands

band calculation for BCC  $\Gamma - H$  [100] direction

$\mathbf{k}_{\Gamma-H} \equiv \mathbf{k}_x$  between 0 and  $2\pi/a$  (boundary of BZ)

For this direction (5.35) becomes

$$E = \frac{\hbar^2}{2m} \left( \frac{2\pi}{a} x\mathbf{i} + \mathbf{G} \right)^2$$

Where  $x$  may take values between 0 and 1. to start with, let  $\mathbf{G} = 0$ , then

$$E = \frac{\hbar^2}{2m} \left( \frac{2\pi}{a} \right)^2 (x\mathbf{i})^2 \equiv Cx^2 \quad \text{where} \quad C = \frac{\hbar^2}{2m} \left( \frac{2\pi}{a} \right)^2 = \frac{2\hbar^2 \pi^2}{ma^2}$$

this curve is labeled (000) in Fig 5. 18 since  $h_1, h_2, h_3 = 0, 0, 0$  for  $\mathbf{G}=0$

# 5. Energy Bands in Crystals

## 5.6 Free electron Bands

For the case of  $h_1, h_2, h_3 = 0, -1, 0$

$$\mathbf{G} = -\frac{2\pi}{a}(\mathbf{i} + \mathbf{l})$$

combined (5.36) and (5.38)

$$E = \frac{\hbar^2}{2m} \left[ \frac{2\pi x}{a} \mathbf{i} - \frac{2\pi}{a} (\mathbf{i} + \mathbf{l}) \right]^2 = C [\mathbf{i}(x-1) - \mathbf{l}]^2$$

$$C = [(x-1)^2 + 1] = C(x^2 - 2x + 2)$$

For  $x=0 \rightarrow E=2C$

and for  $x=1 \rightarrow E=1C$

The band labeled  $(0 \bar{1} 0)$

in Fig 5.18 obtained.
