> 건축계획연구 - Data Analysis Report. 2017-24447 리나 빈선

The present report presents statistical analyses to test diverse hypotheses based in a survey done in some years ago at Yongin area. The observers noted whether a vehicle stops on red light at the exact stop line or not. They also noted the types and brands of vehicles and the biographical information of the drivers. The different hypothesis here presented are evaluated using the Chi-square (X2) statistical test.

Hypothesis 1: Male drivers are more likely to come to a full stop at the stop line than female drivers.

| Observed Frecuencies (O) | Woman (여자) | Man (남자) | Total man <br> and Woman |
| :--- | ---: | ---: | ---: |
| Keep (잘지킴) | 56 | 388 | 444 |
| slightly Keep (약간넘어감) | 22 | 235 | 257 |
| Do not Keep (안지킴) | 20 | 243 | 263 |
| Total Cases | 98 | 866 | 964 |

| Observed Frecuencies <br> (\%) | Woman (여자) | Man (남자) |
| :--- | ---: | ---: |
| Keep (잘지킴) | $57 \%$ | $45 \%$ |
| slightly Keep (약간넘어감) | $22 \%$ | $27 \%$ |
| Do not Keep (안지킴) | $20 \%$ | $28 \%$ |

| Expected Frecuencies (E) | Woman (여자) | Man (남자) | Total man <br> and Woman |

| Total (X2) |  | 5.525 |

Chi-Square(X2)
5.525

Probability ( $P$ )
Degrees of Freedom (df)
0.063

2

## Results.

Since the $P$-value ( 0.063 ) is greater than the significance level $(0.05)$, we accept the null hypothesis. Thus, we conclude that there is a relationship between gender and keeping the stop line. Also, the test results show that the differences are likely to change.

Hypothesis 2: The older drivers are more likely to observe the stop line than the younger drivers.

| Observed Frecuencies (O) | 20 대 | 30 대 | $\mathbf{4 0}$ 대 | 50 대 이상 | Total |

Chi-Square(X2) ..... 9.91
Probability (P) ..... 0.45
Degrees of Freedom (df) ..... 10

## Results.

Since the P-value (0.45) is greater than the significance level (0.05), we accept the null hypothesis. Thus, we conclude that there is a relationship between where are the vehicles come from and keeping the stop line. Also, the test results show that the differences are likely to change.

Hypothesis 4: There are differences in observing stop line among these four groups: older males, younger males, older females, and younger females.

| Observed Frecuencies (O) | 20 대 | 30 대 | 40 대 | 50 대 <br> 이상 |  |
| :--- | ---: | ---: | ---: | ---: | ---: |
