

Homework1. Solution

1. For potential flow

$$u = \frac{\partial \phi}{\partial x} = 6ye^{3z} \cos x \quad \rightarrow \quad \phi = 2ye^{3z} \sin 3x + f(y, z) \quad (1.1)$$

$$v = \frac{\partial \phi}{\partial y} \quad \rightarrow \quad \phi = 2ye^{3z} \sin 3x + g(x, z) \quad (1.2)$$

(1.3)=(1.4) \diamond [므로

$$f(y, z) = g(x, z) \quad \rightarrow \quad f(z) = g(z) \equiv F(z)$$

Continuity eq : $\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z} = 0$

$$\frac{\partial w}{\partial z} = -\frac{\partial u}{\partial x} - \frac{\partial v}{\partial y} = -\left(-18ye^{3z} \sin 3x + \cancel{\frac{\partial^2 F}{\partial x^2}} \right) - \cancel{\frac{\partial^2 \phi}{\partial y^2}} = 0$$

$$\therefore w = 6ye^{3z} \sin 3x + C$$

2.

(1)

$$Fr = \frac{V_{\text{ship}}}{\sqrt{gL_{\text{ship}}}} = \frac{V_{\text{model}}}{\sqrt{gL_{\text{model}}}}, \quad V_{\text{ship}} = Fr \times \sqrt{gL_{\text{ship}}} = 10.8 \text{ m/s}$$

$$V_{\text{model}} = V_{\text{ship}} \times \sqrt{\frac{L_{\text{model}}}{L_{\text{ship}}}} = 10.8 \times \sqrt{\frac{1}{100}} = 1.08 \text{ m/s}$$

(2)

$$\text{Assume : } \frac{F}{\rho L^2 U^2} \approx f'(\frac{gL}{U^2})$$

$$\frac{F_{\text{ship}}}{\rho L_{\text{ship}}^2 V_{\text{ship}}^2} = \frac{F_{\text{model}}}{\rho L_{\text{model}}^2 V_{\text{model}}^2}$$

$$F_{\text{ship}} = F_{\text{model}} \frac{L_{\text{ship}}^2 V_{\text{ship}}^2}{L_{\text{model}}^2 V_{\text{model}}^2} = F_{\text{model}} \frac{L_{\text{ship}}^3}{L_{\text{model}}^3} = 10kN \times 100^3 = 10^7 kN$$

$$(3) \quad \text{Re} = \frac{VL}{\nu} = \frac{1.08 \times 3}{1.13902 \times 10^{-6}} = 2.855 \times 10^6 \text{ (15°C, freshwater)}$$

$$(4) \quad Fr = \frac{V}{\sqrt{gL}}, \quad \text{Re} = \frac{VL}{\nu}$$

Fr수는 $\frac{V}{\sqrt{L}}$ 이고, Re수는 VL 이 비례하므로 모형실험에서 실선과 모형선의 Fr를

맞혀주는 V는 적당하지만 Re를 맞혀주는 모형선의 V는 축적 비에 반비례하기 때문에 매우 빠르거나 유체를 물이 아닌 다른 것을 써서 kinematic viscosity를 변화시켜야 한다. 이는 현실적으로 거의 불가능하다.

3.

$$(1) \text{Continuity eq : } \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z} = 0$$

$$(2) \nabla \times \vec{V} = 0$$

(3) ideal fluid이고 irrotational flow이면 velocity potential, Φ 을 정의할 수 있다.

$$\nabla \cdot \vec{V} = 0, \text{ } \Rightarrow \vec{V} = \nabla \cdot \Phi \text{ } \Rightarrow \nabla \cdot (\nabla \cdot \Phi) = \nabla^2 \cdot \Phi = 0$$

$$4. (1) \Phi = \Phi_1 + \Phi_2 = Ur \cos \theta + \frac{m}{2\pi} \ln r$$

$$(2) \Phi = Ux + \frac{m}{2\pi} \ln(x^2 + y^2)^{1/2}, \quad (x,y)=(0,0) \text{ at source center}$$

$$\nabla^2 \Phi = \frac{\partial^2 \Phi}{\partial x^2} + \frac{\partial^2 \Phi}{\partial y^2} = 0$$

$$\frac{\partial \Phi}{\partial x} = U + \frac{m}{2\pi} (x^2 + y^2)^{-1} \cdot x = 0$$

$$\frac{\partial^2 \Phi}{\partial x^2} = \frac{m}{2\pi} (y^2 - x^2)(x^2 + y^2)^{-2} = 0$$

$$\frac{\partial \Phi}{\partial y} = \frac{m}{2\pi} (x^2 + y^2)^{-1} \cdot y = 0$$

$$\frac{\partial^2 \Phi}{\partial y^2} = \frac{m}{2\pi} (x^2 - y^2)(x^2 + y^2)^{-2} = 0$$

$$\therefore \nabla^2 \Phi = 0$$

**다른 풀이

$$\nabla^2 \Phi = \frac{\partial^2 \Phi}{\partial r^2} + \frac{1}{r} \cdot \frac{\partial \Phi}{\partial r} + \frac{m}{2\pi r^2}$$

$$\frac{\partial^2 \Phi}{\partial r^2} = -\frac{m}{2\pi r^2}$$

$$\frac{1}{r} \cdot \frac{\partial \Phi}{\partial r} = \frac{1}{r} \left(U \cos \theta + \frac{m}{2\pi r} \right) = \frac{U}{r} \cos \theta + \frac{m}{2\pi r^2}$$

$$\frac{m}{2\pi r^2} = \frac{1}{r^2} (-Ur \cos \theta) = -\frac{U}{r} \cos \theta$$

$$\nabla^2 \Phi = -\frac{m}{2\pi r^2} + \frac{U}{r} \cos \theta + \frac{m}{2\pi r^2} - \frac{U}{r} \cos \theta = 0$$

$$\therefore \nabla^2 \Phi = 0$$

(3)

$$\Phi = Ux + \frac{m}{2\pi} \ln(x^2 + y^2)^{1/2}$$

$$\frac{\partial \Phi}{\partial y} = \frac{m}{4\pi} (x^2 + y^2)^{-1} \cdot 2y = 0 \quad \Rightarrow \quad y = 0$$

$$\frac{\partial \Phi}{\partial x} = U + \frac{m}{4\pi} (x^2 + y^2)^{-1} \cdot 2x = 0$$

위 식에 $y=0$ 을 대입하면

$$\frac{\partial \Phi}{\partial x} = U + \frac{m}{2\pi} (x)^{-1} = 0$$

$$x = -\frac{m}{2\pi U}$$

$$\therefore \text{stagnation point} = \left(-\frac{m}{2\pi U}, 0 \right)$$

(4) Bernoulli's Eq을 사용하면,

$$p_s + \frac{1}{2} \rho \vec{V}_s^2 + \rho g z = p_{\infty} + \frac{1}{2} \rho \vec{U}^2 + \rho g z$$

Stagnation point에서의 속도, $\vec{V}_s = 0$ 으로

$$p_s = p_{\infty} + \frac{1}{2} \rho \vec{U}^2 \quad \text{이다.}$$

5.

Euler equations

$$X - \frac{1}{\rho} \frac{\partial p}{\partial x} = u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} + w \frac{\partial u}{\partial z} + \frac{\partial u}{\partial t} \quad \dots\dots \textcircled{1}$$

$$Y - \frac{1}{\rho} \frac{\partial p}{\partial y} = u \frac{\partial v}{\partial x} + v \frac{\partial v}{\partial y} + w \frac{\partial v}{\partial z} + \frac{\partial v}{\partial t} \quad \dots\dots \textcircled{2}$$

$$Z - \frac{1}{\rho} \frac{\partial p}{\partial z} = u \frac{\partial w}{\partial x} + v \frac{\partial w}{\partial y} + w \frac{\partial w}{\partial z} + \frac{\partial w}{\partial t} \quad \dots\dots \textcircled{3}$$

Assumptions

i) Incompressible and irrotational flow

$$\nabla \phi = \left(\frac{\partial \phi}{\partial x}, \frac{\partial \phi}{\partial y}, \frac{\partial \phi}{\partial z} \right) = (u, v, w)$$

$$\frac{\partial u}{\partial y} = \frac{\partial v}{\partial x}, \quad \frac{\partial u}{\partial z} = \frac{\partial w}{\partial x}, \quad \frac{\partial v}{\partial z} = \frac{\partial w}{\partial y}$$

i) The extraneous force components are given by

$$X = -\frac{\partial \Omega}{\partial x}, \quad Y = -\frac{\partial \Omega}{\partial y}, \quad Z = -\frac{\partial \Omega}{\partial z}.$$

$$\textcircled{1} \Rightarrow u \frac{\partial u}{\partial x} + v \frac{\partial v}{\partial x} + w \frac{\partial w}{\partial x} + \frac{\partial^2 \phi}{\partial t \partial x} + \frac{\partial \Omega}{\partial x} + \frac{1}{\rho} \frac{\partial p}{\partial x} = 0$$

$$\frac{\partial}{\partial x} \left(\frac{1}{2} u^2 + \frac{1}{2} v^2 + \frac{1}{2} w^2 + \frac{\partial \phi}{\partial t} + \Omega + \frac{p}{\rho} \right) = 0$$

Integrate with respect to x

$$\frac{\partial \phi}{\partial t} + \frac{1}{2} (u^2 + v^2 + w^2) + \Omega + \frac{p}{\rho} = F_1(y, z, t)$$

$$\textcircled{2} \Rightarrow \frac{\partial \phi}{\partial t} + \frac{1}{2} (u^2 + v^2 + w^2) + \Omega + \frac{p}{\rho} = F_2(x, z, t)$$

$$\textcircled{3} \Rightarrow \frac{\partial \phi}{\partial t} + \frac{1}{2} (u^2 + v^2 + w^2) + \Omega + \frac{p}{\rho} = F_3(x, y, t)$$

$$\therefore \underline{\underline{\frac{\partial \phi}{\partial t} + \frac{1}{2} |\nabla \phi|^2 + \Omega + \frac{p}{\rho} = F(t)}}$$

● gravity is the only extraneous force acting,

$$\Omega = gz$$

$$\therefore \underline{\underline{\frac{1}{2} |\nabla \phi|^2 + \frac{\partial \phi}{\partial t} + gz + \frac{p}{\rho} = F(t)}}$$

● steady flow의 경우

$$\therefore \underline{\underline{\frac{1}{2} |\nabla \phi|^2 + gz + \frac{p}{\rho} = C}} \quad (C: \text{constant})$$
