## Example question: Nucleophilic reactions

Following concentrations for anionic constituents are determined for a water sample with a pH value of 7.0 at $25^{\circ} \mathrm{C}$.

| Constituents | Ionic weight | Concentration (mg/L) |
| :---: | :---: | :---: |
| $\mathrm{NO}_{3}{ }^{-}$ | 62.0 | 27.2 |
| $\mathrm{SO}_{4}{ }^{2-}$ | 96.1 | 76.5 |
| $\mathrm{Cl}^{-}$ | 35.5 | 204.7 |
| $\mathrm{OH}^{-}$ | 17.0 | can be derived from pH |

The $n_{N u, C H_{3} B r}$ values for the anions are shown below:

| Anionic nucleophiles | $n_{N u, C H_{3} B r}$ |
| :--- | :--- |
| $\mathrm{NO}_{3}{ }^{-}$ | 1.0 |
| $\mathrm{SO}_{4}{ }^{2-}$ | 2.5 |
| $\mathrm{Cl}^{-}$ | 3.0 |
| $\mathrm{OH}^{-}$ | 4.2 |

i) Determine the $[\mathrm{Nu}]_{50 \%}$ values for the anionic nucleophiles assuming $\mathrm{s}=1$. Considering the $[\mathrm{Nu}]_{50 \%}$ values and the nucleophile concentrations, list nucleophiles that are significant for reaction with $\mathrm{CH}_{3} \mathrm{Br}$ in the water. If the reaction rate for a nucleophile is more than 5\% of the hydrolysis rate, determine the nucleophile as significant.
ii) If $10^{-5} \mathrm{M}$ of $\mathrm{CH}_{3} \mathrm{Br}$ is added to the water sample, what will be the concentration of the products of nucleophilic substitution (including hydrolysis) after all the reactions occur completely? Consider only significant nucleophiles.
