# Week 5 Project Work Plan

**457.657 Civil and Environmental Project Management** Department of Civil and Environmental Engineering Seoul National University

> **Prof. Seokho Chi** <u>shchi@snu.ac.kr</u> 건설환경공학부 35동 304호

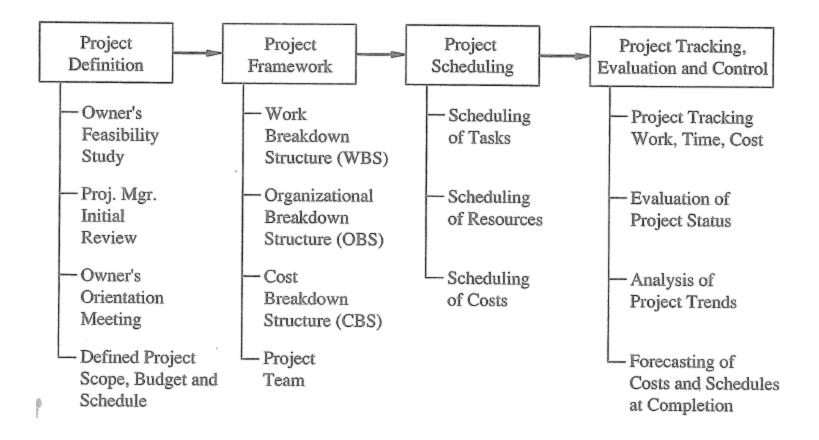

# **Project Work Plan**

### • Identifies the work to be done

- Who will do it, When
- Costs
- Basic components
  - Overview/Directory
    - Project title, objective scope, organization chart
  - Tasks
    - List of tasks, groupings
  - Schedule
    - Sequencing and interdependencies, durations, start/finish
  - Budget
    - Labor hours and staff costs, billing approach
  - Measurement
    - Accomplishment of tasks, completion of work package

2014 Semester 1

### Phases of Development of Work Plan

#### 457.657 Civil and Environmental Project Management

#### 2014 Semester 1

# Work Plan Development

- 1. PM initial duty is to review sponsoring organization material regarding
  - Project scope
  - Budget
  - Schedule

#### 2. Meet with sponsor to determine requirements and priorities for

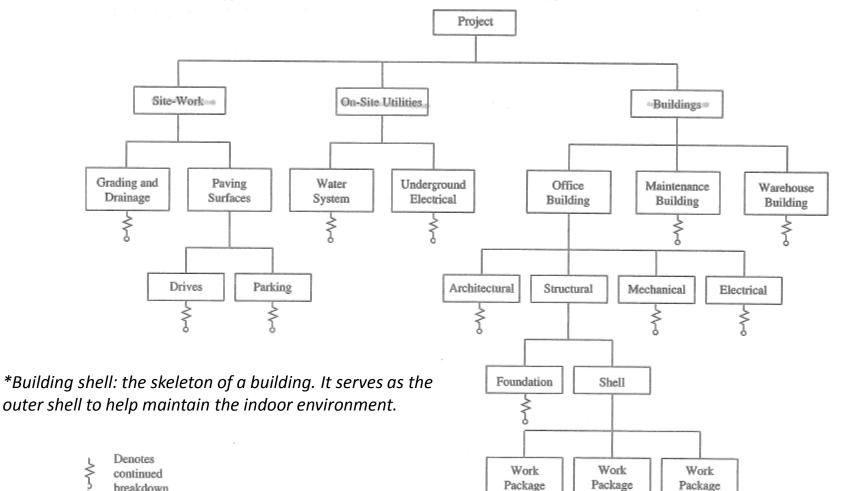

- Quality
- Scope
- Time
- Cost
- Determine owner's level of involvement

#### 3. Develop work breakdown structure (WBS)

- Define work to be performed
- Identify needed expertise
- Select project team
- Establish project schedule and controls

#### 2014 Semester 1

• Divides the project into identifiable part that can be managed

2014 Semesici 1

437.037 CIVII and Environmental Froject management

- Divides the project into identifiable part that can be managed
- Concept of WBS is simple: to manage the whole project must control each of the parts
- All the work contained within the WBS is to be identified, estimated, scheduled, budgeted, and controlled
  - Identifying work, compiling the budget, and developing an integrated schedule
- Shown in graphical display to organize and subdivide the total scope of work

- Project work is structured into WBS elements (work packages) must be:
  - Definable: easily described and understood
  - <u>Manageable</u>: meaningful unit of work where specific responsibility can be assigned
  - Estimateable: duration and costs can be estimated
  - <u>Independent</u>: minimum interface with or dependence on other ongoing elements
  - Integratable: integrates with other project work elements
  - <u>Measureable</u>: has start and completion dates and interim milestones
  - <u>Adaptable</u>: flexible so the addition elimination of work scope can be accommodated

2014 Semester 1

### • Characteristics of WBS

- Most commonly produced in the form of a table or chart
- Procedure in the associated work flow is used to produce this work product
- Progresses downward from the general to the specific
- Provides a framework for turning project objectives into specific deliverables

- Typical levels of WBS
  - Level 1: Total program
  - Level 2: Project
  - Level 3: Task
  - Level 4: Subtask
  - Level 5:
- Work package

Managerial Levels

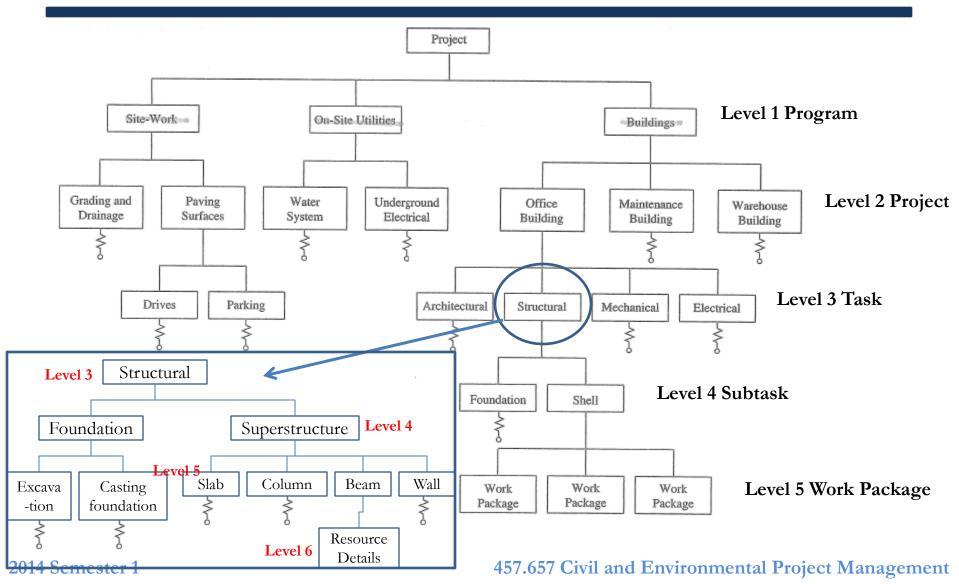

**Technical Levels** 

– Level 6: Level of effort

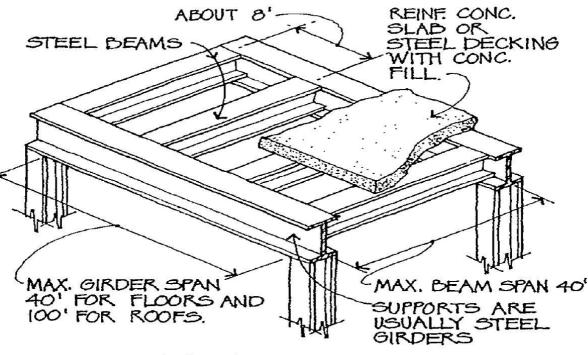

### • Upper 3 levels normally specified by the owner

- Level 1: authorization and release of work
- Level 2: budgets prepared
- Level 3: schedules prepared
- Lower 3 levels are generated by the contractor

2014 Semester 1

## Superstructure

#### STEEL BEAM AND GIRDER SYSTEM

- · BEAMS AND GIRDERS MAY BE PART OF MAIN SKELETON FRAME
- · COMPOSITE ACTION BETWEEN BEAM AND SLAD POSSIBLE
- · ECONOMICAL FOR MOST BUILDING LOADS.

A girder is the primary horizontal member carrying loads from other beams and slabs connected to it. That is a girder has other beams connecting to it on its sides .Typically beams do not have other beams connecting to it but generally have only slabs transferring the loads to it.

#### 2014 Semester 1

## WBS

- Work Package
  - Lowest level in the WBS
  - Baseline for scheduling, tracking, cost control

# Work Packaging

"A work package is a **well defined scope of work** that terminates in a deliverable product(s) or completion of a service. Each package may vary in size, but it must be a measurable and controllable unit of work to be performed. To complete a work package, one or more tasks will be performed. Thus, a work package may encompass the work of more than one crew or staff." (CII, 1988)

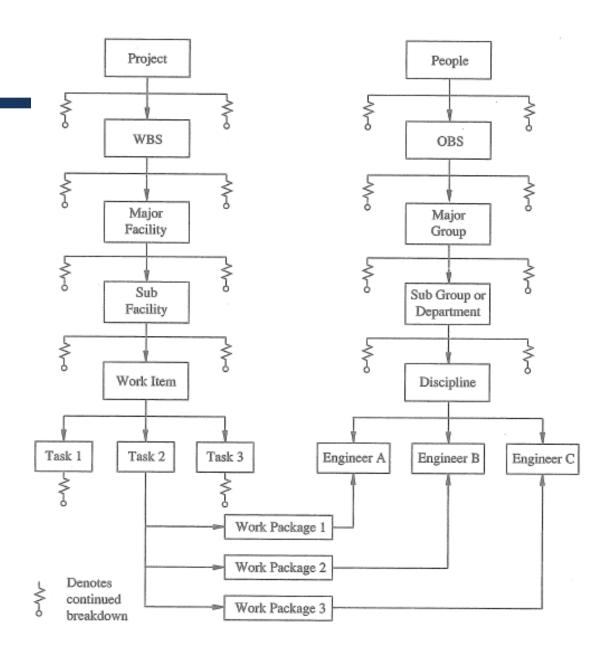

# Good work packages

- Connects the abstract (schedules, production analysis) with the physical
- To link schedules into production, consider
  - A complete design
  - A list of materials to be installed
  - A specific area to be worked on
  - A start and end date (handover dates)
  - A materials handling plan

# WBS vs OBS

- WBS: define the work to be accomplished
- OBS

   (Organizational Breakdown
   Structure)
  - Define who is responsible for performing the work

#### 457.657 Civil and Environmental Project Management

#### 2014 Semester 1

# Site Layout

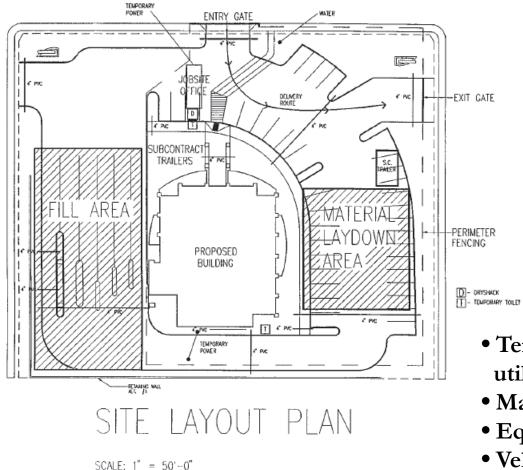

### • Definition:

- Assigning areas to staging, materials storage, and shared resources (e.g., cranes)

### • Site layout is:

- Dynamic; can cause access conflicts
- Should be considered with work packaging when developing construction plan
- Site layout (big picture) constraints, then
  - Work packaging <--> Site layout (micro analysis)

# Jobsite Layout

- Temporary facilities, power and utilities
- Material storage and handling
- Equipment location
- Vehicle and personnel routes, access and exit

457.657 Civil and Environmental Project Management

#### 2014 Semester 1

# Jobsite Layout Overview

- Jobsite layout plan
  - Plan for temporary facilities, material movement, storage, and handling

### • Areas of consideration

- Labor productivity
- Material handling
- Equipment constraints
- Site constraints

### • Jobsite layout plan aspects

- Jobsite space allocation
- Jobsite access
- Material handling
- Worker transportation
- Temporary facilities
- Jobsite security

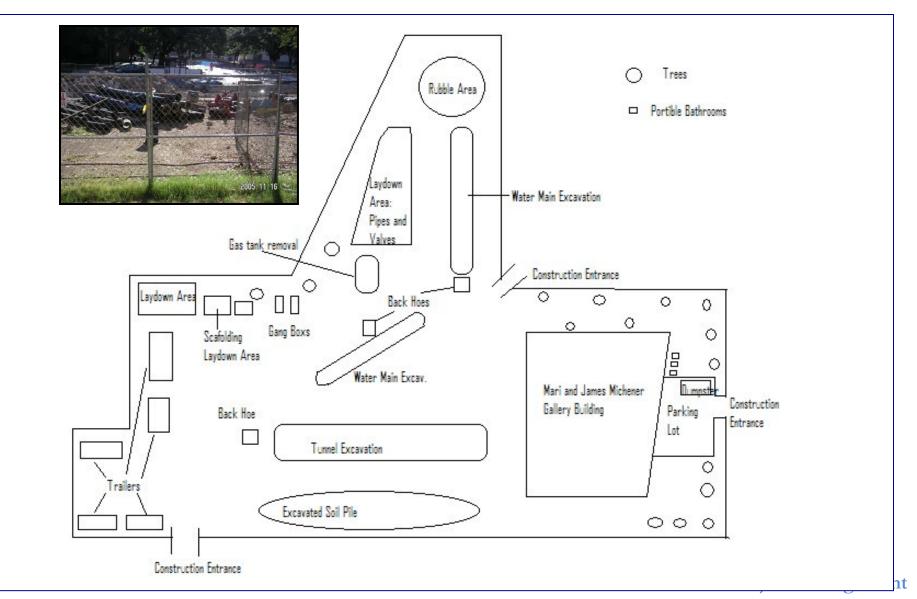

2014 Semester Signage and barricades

# Labor Productivity

### • Travel time: non-productive time elements

- From gate to worksite
- To sanitary facilities (for toilet, gas, water, etc.)
- Coffee breaks and lunch
- Moving material and asking questions
- Need to be minimum!

# Piping Activity: Layout

# Week 5 Project Scheduling (1)

**457.657 Civil and Environmental Project Management** Department of Civil and Environmental Engineering Seoul National University

> **Prof. Seokho Chi** <u>shchi@snu.ac.kr</u> 건설환경공학부 35동 304호

# Project Scheduling (PMBOK Chapter 6)

### Project Time Management

- Includes the process required to ensure timely completion of the project
- Major Processes
  - 1. Activity definition
  - 2. Activity sequencing
  - 3. Activity duration estimation
  - 4. Schedule development
  - 5. Schedule control

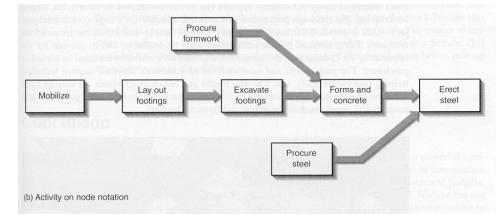

## **Project Scheduling – Activity Definition**

- WBS being the basis for development of the final activity list
- Tools and Techniques
  - Decomposition
    - Involves subdividing project elements into smaller, more manageable components in order to provide better management control
  - Templates
    - An activity list, or a portion of an activity list from a previous project, is often usable as a template for a new project
    - Resource skills, required hours of effort, risk identification, expected deliverables, etc.

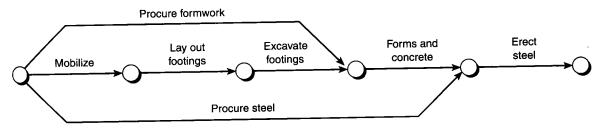

2014 Semester 1

## Project Scheduling – Activity Sequencing

- Identifying interactivity dependencies
  - Precedence Diagramming Method (PDM) called Activity-On-Node

 Arrow Diagramming Method (ADM) called Activity-On-Arrow (AOA), "old school" not much used as more

#### 2014 Semester 1

(AON)

#### **:t Management**

## **Project Scheduling – Activity Sequencing**

### • Precedence Notation

- Activities or operations are placed on nodes
- Arrows defines relationships between activities
  - Finish to Start
  - Start to Start
  - Finish to Finish
  - Start to Finish
- Apply "leads" and "lags" provide ability to overlap activities, allowing the scheduler to model more accurately the project's operation

### **Project Scheduling – Duration Estimate**

- Estimating the number of work periods which will be needed to complete individual activities
- Tools and Techniques
  - Expert judgment: historical information may be used
  - Analogous estimating: called top-down estimation, means using the actual duration of a previous, similar activity
  - Simulation: involves calculating multiple durations with different sets of assumptions

## **Project Scheduling – Duration Estimate**

- Duration of an activity varies according to the activity type
  - Production
    - Consult subcontractors
    - Calculate based on quantity and productivity
    - Job conditions, new construction vs. renovation, crew size, work schedule, weather, project calendar, resource calendar
  - Procurement
    - Consult suppliers
    - Review contract documents
  - Administrative
    - Consult agencies
    - Past projects

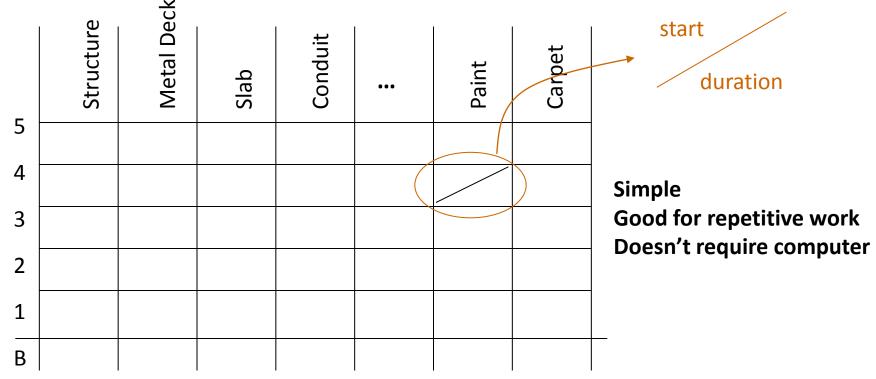

2014 Semester 1

### • Bar (Gantt) chart

2014 Semest

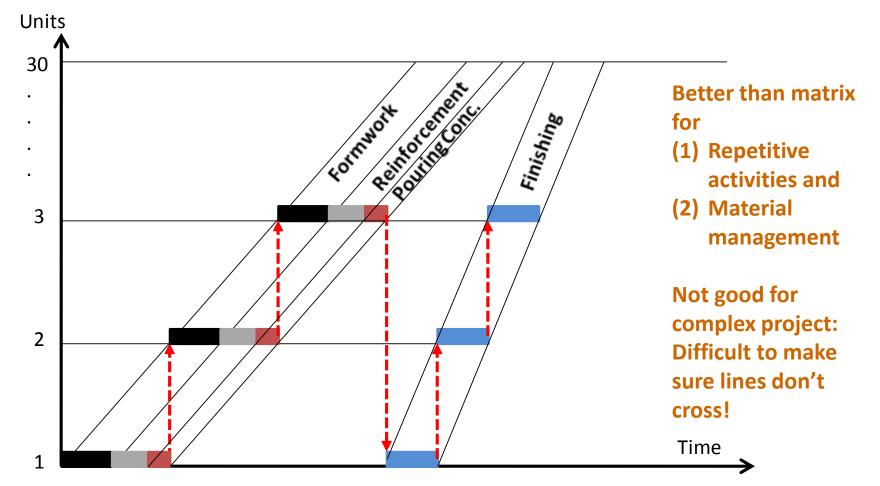

• Matrix Schedules

Hard to use for complex work Typically useful only for part of project Difficult to define relationships

2014 Semester 1

• Line of Balance

2014 Semester 1

### • Terminology

- <u>Early Start (ES)</u>: earliest possible time an activity can start based on the logic and durations identified in the network
- <u>Early Finish (EF)</u>: earliest possible time an activity can finish based on the logic and durations identified in the network

#### • EF = ES + Activity Duration

- <u>Late Finish (LF)</u>: latest possible time an activity can finish based on the logic and durations identified in the network without extending the completion date of the project
- <u>Late Start (LS)</u>: latest possible time an activity can start based on the logic and durations identified in the network without extending the completion date of the project
  - LS = LF Activity Duration

2014 Semester 1

### • Terminology

- <u>Float</u>: additional time an activity can use beyond its normal duration and not extend the completion date of the project
  - <u>Total Float (TF)</u>: maximum time an activity can be delayed without delaying the project completion
  - <u>Free Float (FF)</u>: maximum time an activity can be delayed without delaying the start of any succeeding activity
- <u>Critical Path</u>: path from start to finish with no float.
  Therefore, it is the minimum time to complete the project and highly impacts on the entire project schedule.
  <u>Delay in Critical Path = Project Delay!</u>

2014 Semester 1

### Development Methods

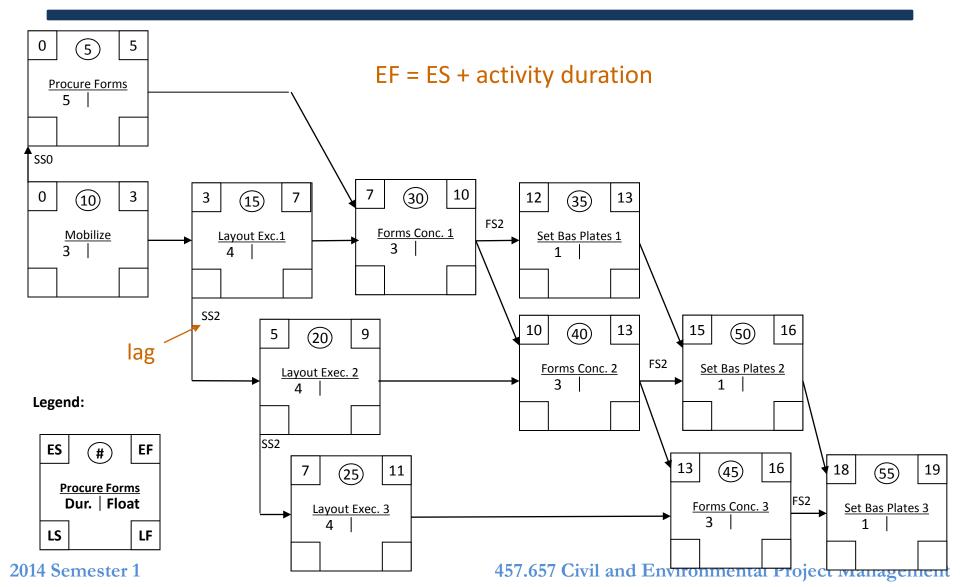

- <u>Critical Path Method (CPM)</u>: calculates a single, deterministic early and late start and finish date for each activity based on specified, sequential network logic and using duration estimate
- <u>Program Evaluation and Review Technique (PERT)</u>: uses sequential network logic and a weighted average duration estimate to calculate project duration

- Network Forward Path Calculations AON
  - AON (precedence notation) Finish to Start Links
    - Activities without predecessors
      - Early Start = 0
      - Early Finish = Early Start + Activity Duration
    - Activities with predecessors
      - Early Start = maximum Early Finish among predecessors
      - Early Finish = Early Start + Activity Duration

IMPORTANT: Pay attention when working with different link types or when there are leads/lags

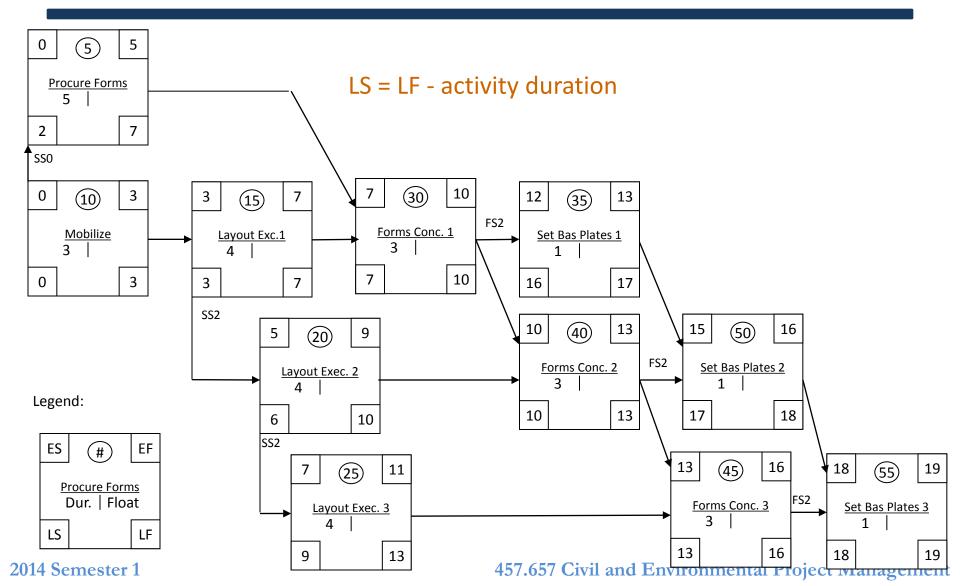

2014 Semester 1

## Forward Path Calculation

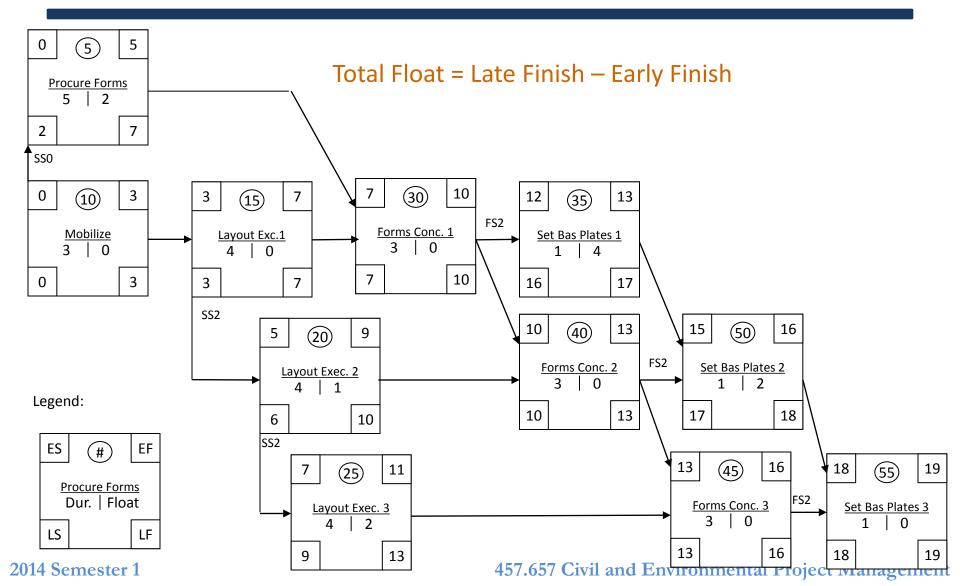

- Network Backward Path Calculations AON
  - AON (precedence notation) Finish to Start Links
    - Activities without successors
      - Late Finish = Early Finish (or project duration)
      - Late Start = Late Finish Activity Duration
    - Activities with successors
      - Late Finish = minimum Late Start among successors
      - Late Start = Late Finish Activity Duration

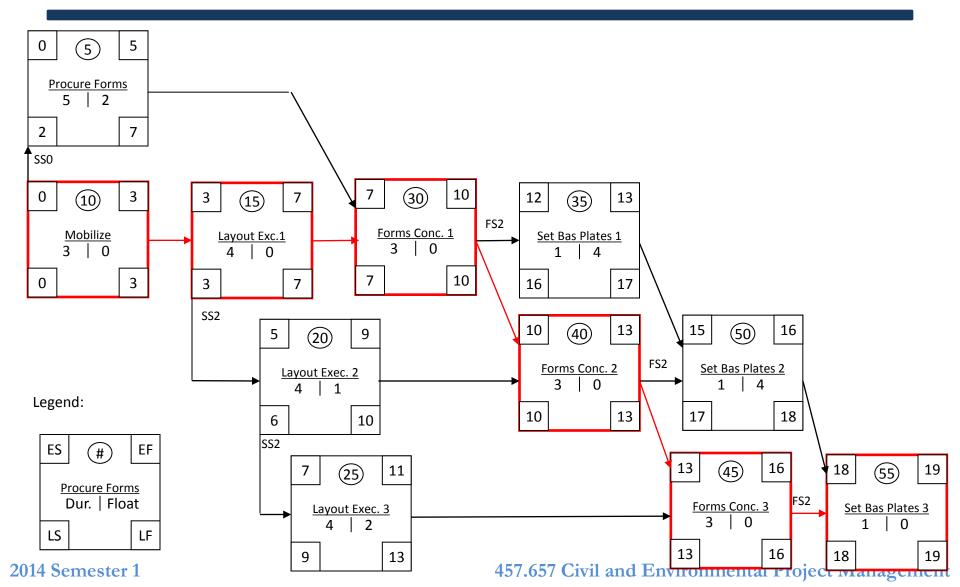

#### **Backward Path Calculation**

#### **Total Float Calculation**

#### **Critical Path**

#### Project Scheduling – Schedule Development

#### • Duration Compression

- Looks for ways to shorten the project schedule without changing the project scope
- <u>Fast Tracking</u>: means you look at activities normally done in sequence and assign them instead partially in parallel. For instance, you would start construction in areas where you felt the design was pretty solid without waiting for the entire design to be completed. **Rework and Risk** ↑
- <u>Crashing</u>: means to throw additional resources with additional costs to the critical path without necessarily getting the highest level of efficiency. For instance, you might add a second worker to the activity usually performed by one worker. Cost ↑

#### Project Scheduling – Schedule Control

- Controlling changes to the project schedule
- Tools and Techniques
  - Schedule change control system: includes the paperwork, tracking systems, and approval levels
  - Performance measurement: assesses the magnitude of any variations
  - Additional planning: due to prospective changes

#### **Project Scheduling – Schedule Control**

### **Group Assignment Exercise**

The U.S. Navy plans to design and construct two new recruit barracks to replace the old ones built between the years of 1958 and 1966, located at Naval Station Great Lakes, Illinois. This movement is a part of the RTC RECAP project, transforming Boot Camp from a deficient, facility-centric base into a state-of-theart, training-centric environment. The entire project includes the development of the complete infrastructure (roads, sidewalks, utilities, storm drainage, elevated water tank, railroad underpass, landscaping, etc.) for a 48-acre parcel of land, adjacent to the existing RTC campus. Additional incidental related work must also be considered to provide a complete and useable facility. Each barrack will measure 16,700 square meters and will provide open bay housing for 1,100 recruits, classrooms, and advanced food service and dining facility. The total estimate cost is approximately \$80 million including two barrack (each \$30 million) facilities and green land development.

# Group Assignment Exercise

• Assuming a planning time of 6 months for the project, develop a high-level schedule for the project, showing planning, acquisition, design and construction
