Fusion Reactor Technology I
(459.760, 3 Credits)

Prof. Dr. Yong-Su Na
(32-206, Tel. 880-7204)
Contents

Week 1. Magnetic Confinement/Fusion Reactor Energetics (Harms 8)
Week 2. Tokamak Operation (I):
   Basic Tokamak Plasma Parameters (Wood 1.2-3, Harms 9.2, Kadomtsev 6)
Week 4. Tokamak Operation (II): Startup
Week 5. Tokamak Operation (III): Tokamak Operation Mode
Week 7-8. Tokamak Operation Limits (I):
   Plasma Instabilities (Kadomtsev 6, 7, Wood 6)
Week 9-10. Tokamak Operation Limits (II):
   Plasma Transport (Kadomtsev 8, 9, Wood 3, 4)
Week 11. Heating and Current Drive (Kadomtsev 10)
Week 12. Divertor and Plasma-Wall Interaction
Week 13-14. How to Build a Tokamak (Dendy 17 by T. N. Todd)
Objectives of the Tokamak Operation

\[ n \tau_E T \geq 3 \times 10^{21} m^{-3} keVs = 5 \text{ bar} \cdot s \]

- High \( <n_e>/n_{GW} \)
- High \( \beta_N \)
- High \( H_{98}(y,2) \)
- Pulse length
Plasma Equilibrium, Stability and Transport

Plasma (Plasma pressure)

Tokamak (magnetic pressure)
Objectives of the Tokamak Operation

- No sawteeth, good confinement, and $\beta_N \sim 3.5$, $T_i \sim T_e$, $\langle n_e \rangle / n_{GW} \sim 0.88$, averaged over 3.6 seconds ($\sim 50 \, \tau_E$).
Objectives of the Tokamak Operation

- Fishbones (q=1)
- \( P_{\text{nbi}} \) (MW)
- \( B_N \) / GW
- \( \frac{n_e}{n} \) / GW
- \( I_p \) (MA)
- \( D_\alpha \)
- Small ELMs (type II)
- Outer divertor
- Inner divertor

- \( \approx 18 \text{ MW} / \text{m}^2 \)
- \( \leq 6 \text{ MW} / \text{m}^2 \)
• High-temperature plasma, confined by a magnetic field, is an exceptionally unusual physical object → complex physical system
  - Presence of macroscopic instabilities
  - Local entropy production due to local plasma transport
  - Rare Coulomb collisions (anomalous transport)
  - Non-linear phenomena (noise source) in the edge plasma propagating inside the plasma core leading to transport enhancement
  - Heating resulting in additional noise generation

cf) OH heating: drift current velocity of electrons $\sim 10^5$ m/s
  $\ll$ sound velocity ($j \sim 1$ MA/m$^2$, $n_e \sim 10^{20}$ m$^{-3}$)

$$V_{Alfven} = \sqrt{\frac{B_0^2}{\mu_0 \rho_0}}, \quad V_{adiabatic \ sound} = \sqrt{\frac{\gamma p_0}{\rho_0}}$$
Plasma as a Complex System

• A rational approach to study complex systems consists of a large number of experiments aimed at understanding empirical laws supported by development of a theoretical description and computer models.
• All this is actively used in modern tokamak studies.
• As experience with other complex systems shows, the general method of scaling and dimensional approach represents a powerful tool for their description.
Dimensional Analysis of Tokamaks

- **Dimensional approach**
  - All the laws of physics are based on mechanics.
  - Mechanics uses conventionally chosen units for mass, length, and time.
  - The objective laws of nature cannot depend on those units. These laws are invariant with respect to variations of measurement units chosen by man.
  - This invariance is seen more precisely when non-dimensional combinations of dimensional values are used.
  - The non-dimensional parameters define the internal physics of a complex system: indicators of the fundamental state of the system.
  - Dimensional parameters look like some projection of a given system on the external world.
Dimensional Analysis of Tokamaks

- **Dimensional approach - Example**

- Reynolds number

\[
Re = \frac{\rho v_s^2 / L}{\mu v_s / L^2} = \frac{\rho v_s L}{\mu} = \frac{v_s L}{\nu} = \frac{\text{Inertial forces}}{\text{Viscous forces}}
\]

- \(\rho\): density of the fluid
- \(v_s\): mean velocity of the object relative to the fluid
- \(L\): travelled length of the fluid
- \(\mu\): dynamic viscosity
- \(\nu\): kinetic viscosity

Variation in flow pattern and drag coefficients for cylinders with increase in Reynolds number (Hoerner 1965)
Dimensional Analysis of Tokamaks

- **Dimensional approach**
  - Being immersed in the external physical world, each complex system can possess a non-unique set of dimensional parameters.
  - For a given set of dimensionless parameters the family of systems can exist with different sets of dimensional parameters.
    → Self-similarity
  - Therefore, all the objective laws of physics may be presented as relations between non-dimensional parameters.
  - Dimensional analysis should always be based on reasonable physical parameters which are specific for each particular case. Such an approach can allow us to pick out the most relevant parameters and to drop the unimportant ones.
Identity (Similarity) Experiments

- Plasma shapes used in JET compared to ASDEX Upgrade

\[ \delta \approx 0.20 \quad \delta \approx 0.44 \]
Identity (Similarity) Experiments

AUG 17870 (2.1T)

\[ I_p (MA) \]

\[ P_{NBI} (MW) \]

\[ T_{i0} (keV) \]

JET 58323 (1.7T)

\[ q_{95} \]

\[ H_{98}(\gamma,2) \]

\[ \beta_N \]

Small MHD modes
Dimensionless Parameters

- All the dimensional parameters

\[ a, R, B_T, B_p, m_e, m_i, e, n, T \]

- Frequently used non-dimensional parameters for tokamak plasmas

\[ A = R / a \]

\[ q_a = aB_T / RB_p \]

\[ \beta = p2\mu_0 / B_T^2 = 4\mu_0 nT / B_T^2 \]

\[ \rho^* = \frac{\rho_i}{a} = \left( \frac{2T_i}{m_i} \right)^{1/2} \frac{m_i}{eBa} \]

\[ v^* = v_{ii} \left( \frac{m_i}{T_i} \right)^{1/2} \left( \frac{R}{a} \right)^{3/2} qR \]
Basic Tokamak Variables

- Cylindrical and local coordinates for a tokamak

- Aspect ratio: $R_0/a \sim 3-5$
  
ex) KSTAR: 3.6, ITER: 3.1
- Inverse aspect ratio: $\varepsilon = a/R_0$
Basic Tokamak Variables

- **Plasma configuration**
  - Last Closed Flux Surface
  - LCFS = "Separatrix"
  - X-point
  - Strike point
  - Scrape-off layer
  - X-point
  - Strike point
  - Divertor target plates

- Advantage of the divertor configuration
  - First contact with material surface at a distance from plasma boundary
  - Reducing the influx of ionized impurities into the interior of the plasma by diverting them into an outer "SOL"

If no limiter and divertor?

Plasma diffusing into the whole vessel along the magnetic field → if touching the wall, impurities coming out
Basic Tokamak Variables

- Plasma equilibrium parameters

- Elongation: $\kappa$
- Triangularity: $\delta$
- Squareness: $\zeta$
Basic Tokamak Variables

- Plasma equilibrium parameters

\[ \kappa = \frac{b}{a} \quad \delta = \frac{c}{a} \quad \delta = \frac{c + d}{2a} \]

\[ R = R_0 + a \cos(\theta - \delta \sin \theta) \]

\[ Z = \kappa a \sin \theta \]
Basic Tokamak Variables

• Plasma equilibrium parameters

- Outer and inner squareness: $\zeta_{o,i}$

$$R = R_0 + a \cos(\theta + \sin^{-1} \delta \sin \theta)$$
$$Z = \kappa a \sin(\theta + \zeta_{o,i} \sin 2\theta)$$

Homework: derive!

- Plasma shape
Basic Tokamak Variables

- **Plasma Equilibrium**

  \[ \nabla p = \vec{J} \times \vec{B} \quad \rightarrow \text{Force balance} \]
  \[ \nabla \times \vec{B} = \mu_0 \vec{J} \quad \rightarrow \text{Ampere's law} \]
  \[ \nabla \cdot \vec{B} = 0 \quad \rightarrow \text{Closed magnetic field lines} \]

  \[ \vec{B} \cdot \nabla p = 0 \quad \vec{J} \cdot \nabla p = 0 \]

  induced by the pressure gradient:
  causing a decrease in \( \vec{B} \rightarrow \text{diamagnetism} \)

  Diamagnetic current

  \[ \vec{v}_{D,p} = -\frac{\nabla p \times \vec{B}}{nqB^2} \]
  \[ \vec{J} = n_i q_i \vec{v}_{D,i} + n_e q_e \vec{v}_{D,e} = \frac{\vec{B} \times \nabla p}{B^2} \]

- If \( B_Z \) is applied, plasma equilibrium can be built by itself due to induction of diamagnetic current.
Magnetic Flux Surfaces
- In fusion configurations with confined plasmas the magnetic lines lie on a set of nested toroidal surfaces called flux surfaces.
- Pressure is constant along a magnetic field line.
- Magnetic lines lie in surfaces of constant pressure.
- Flux surfaces are surfaces of constant pressure.
- The current lines lie on surfaces of constant pressure.
- The current flows between flux surfaces and not across them.
- The angle between $\mathbf{J}$ and $\mathbf{B}$ is arbitrary.

\[
\mathbf{J} \times \mathbf{B} = \nabla p \\
\mathbf{B} \cdot \nabla p = 0 \\
\mathbf{J} \cdot \nabla p = 0
\]

If $\mathbf{J} = \mathbf{J}_{||}$,
\[
\mathbf{J} \times \mathbf{B} = \nabla p = 0
\]
Basic Tokamak Variables

• Magnetic Flux Surfaces

- Consider particle motion in a cylindrically symmetric configuration, i.e. $\partial / \partial \theta = 0$

$$\vec{B} = \nabla \times \vec{A}$$

$$\vec{A}(\vec{r}) = \frac{\mu_0}{4\pi} \int \frac{\vec{j}'(\vec{r}')}{|\vec{r} - \vec{r}'|} d^3 r'$$  \text{vector potential}

$$\vec{B} = \nabla \times A_\theta \vec{e}_\theta = -\frac{\partial A_\theta}{\partial z} \vec{e}_r + \frac{1}{r} \frac{\partial}{\partial r} (r A_\theta) \vec{e}_z$$

Equation of particle motion

$$m \frac{d\vec{v}}{dt} = q \left( \vec{E} + \vec{v} \times \vec{B} \right)$$

$$= q \left\{ E_A + \left[ \vec{v} \times \left( -\frac{\partial A_\theta}{\partial z} \vec{e}_r + \frac{1}{r} \frac{\partial}{\partial r} (r A_\theta) \vec{e}_z \right) \right] \right\}$$
Basic Tokamak Variables

• Magnetic Flux Surfaces

\[ \nabla \times \vec{E}_A = -\frac{\partial \vec{B}}{\partial t} = -\nabla \times \frac{\partial \vec{A}}{\partial t} \]

\[ \vec{E}_A = -\frac{\partial \vec{A}}{\partial t} = -\dot{A}_\theta \vec{e}_\theta \]

Equation of particle motion

\[ m \frac{d\vec{v}}{dt} = q \left\{ \vec{E}_A + \left[ \vec{v} \times \left( -\frac{\partial A_\theta}{\partial z} \vec{e}_r + \frac{1}{r} \frac{\partial}{\partial r} (rA_\theta) \vec{e}_z \right) \right] \right\} \]

\[ = q \left\{ -\dot{A}_\theta \vec{e}_\theta + \left[ \frac{v_\theta}{r} \frac{\partial}{\partial r} (rA_\theta) \vec{e}_r - \left( \frac{v_r}{r} \frac{\partial}{\partial r} (rA_\theta) + v_z \frac{\partial A_\theta}{\partial z} \right) \vec{e}_\theta + v_\theta \frac{\partial A_\theta}{\partial z} \vec{e}_z \right] \right\} \]

\[ v_\theta = \dot{l}_\theta = \dot{r} \theta + r \dot{\theta}, \quad v_r = \dot{r}, \quad v_z = \dot{z} \]

\[ \dot{v}_\theta = \ddot{r} \theta + 2 \dot{r} \dot{\theta} + r \ddot{\theta} \]
Basic Tokamak Variables

- Magnetic Flux Surfaces

Equation of particle motion

\[ m \frac{d\vec{v}}{dt} = q \left\{ -\dot{A}_\theta \vec{e}_\theta + \left[ \frac{v_\theta}{r} \frac{\partial}{\partial r} (rA_\theta) \vec{e}_r - \left( \frac{v_r}{r} \frac{\partial}{\partial r} (rA_\theta) + v_z \frac{\partial A_\theta}{\partial z} \right) \vec{e}_\theta + v_\theta \frac{\partial A_\theta}{\partial z} \vec{e}_z \right] \} \]

\[ \theta \)-component

\[ m (r \ddot{\theta} + 2r \dot{\theta}) = -\frac{q}{r} \left( \dot{r} A_\theta + r \dot{A}_\theta + r \frac{\partial A_\theta}{\partial r} + r \frac{\partial A_\theta}{\partial z} \right) \]

\[ = -\frac{q}{r} \left( \dot{r} A_\theta + \frac{\partial A_\theta}{\partial t} + r \frac{\partial r}{\partial t} \frac{\partial A_\theta}{\partial r} + r \frac{\partial z}{\partial t} \frac{\partial A_\theta}{\partial z} \right) \]

\[ = -\frac{q}{r} \left( \dot{r} A_\theta + r \frac{dA_\theta}{dt} \right) \]

\[ = -\frac{q}{r} \frac{d}{dt} \left[ r(t) A_\theta (r, z, t) \right] \]
Basic Tokamak Variables

- Magnetic Flux Surfaces

Multiply by $r$

$$m(r^2 \ddot{\theta} + 2r \dot{r} \dot{\theta}) + r \frac{q}{r} \frac{d}{dt}(r A_\theta) = \frac{d}{dt} \left( m r^2 \dot{\theta} + q r A_\theta \right) = \frac{d}{dt}(l) = 0$$

→ Canonical momentum $l$ due to the rotational motion about the z-axis conserved

$$r A_\theta \left( \frac{m r \dot{\theta}}{q A_\theta} + 1 \right) = \frac{l}{q}$$

$$r A_\theta \left( \frac{m r \dot{\theta}}{q A_\theta} + 1 \right) = r A_\theta \left( \frac{m r \dot{\theta}}{q} \frac{r B_z(0)}{2} + 1 \right)$$

$$= r A_\theta \left( \frac{2m v}{r |q| B_z(0)} + 1 \right) = r A_\theta \left( \frac{2r_l}{r} + 1 \right) = \frac{l}{q} = \text{const.}$$

$$B_z = (\nabla \times A) \cdot \vec{e}_z = \frac{1}{r} \frac{\partial}{\partial r} (r A_\theta)$$

$$A_\theta = \frac{1}{r} \int_0^r r' B_z(r')dr' \approx \frac{1}{2} r B_z(0)$$
Basic Tokamak Variables

- **Magnetic Flux Surfaces**

\[ rA_\theta \left( \frac{2r_L}{r} + l \right) = \frac{l}{q} = \text{const.} \]

- \( r_L/r << 1 \rightarrow \) The trajectories of the particles must lie on surfaces defined by \( rA_\theta = \text{const.} \).

→ Flux surface label:
The particle’s guiding centers move on them in the absence of other forces (as a consequence of angular momentum conservation)

- Magnetic field lines lie within these surfaces which can be readily demonstrated by proving that the surface’s normal is orthogonal to the field.

\[
\vec{B} \cdot \nabla (rA_\theta) = B_r \frac{\partial (rA_\theta)}{\partial r} + B_z \frac{\partial (rA_\theta)}{\partial z} = 0
\]

\[
B_r = \vec{e}_r \cdot (\nabla \times \vec{A}) = - \frac{\partial A_\theta}{\partial z}
\]

\[
B_z = \vec{e}_z \cdot (\nabla \times \vec{A}) = \frac{1}{r} \frac{\partial}{\partial r} (rA_\theta)
\]
**Basic Tokamak Variables**

- **Plasma Equilibrium**

\[
\nabla p = \vec{J} \times \vec{B} \\
\n\nabla \times \vec{B} = \mu_0 \vec{J} \\
\n\nabla \cdot \vec{B} = 0
\]

→ Force balance

kinetic pressure balanced by \( \vec{J} \times \vec{B} \) (Lorentz) force

→ Ampere’s law

→ Closed magnetic field lines

\[
\nabla p = (\nabla \times \vec{B}) \times \vec{B} / \mu_0 \\
= [(B \cdot \nabla)B - \nabla(B^2 / 2)] / \mu_0
\]

\[
\nabla(p + B^2 / 2\mu_0) = (B \cdot \nabla)B / \mu_0
\]

Assuming the field lines are straight and parallel

\[
\frac{E_{mag}^*}{V} = \frac{BH}{2} = \frac{B^2}{2\mu_0}
\]

Total sum of kinetic pressure and magnetic field energy density will be a constant

\[
\frac{p + \frac{B^2}{2\mu_0}}{V} = \text{constant}
\]
Basic Tokamak Variables

• Concept of Beta

\[ \beta = \frac{p}{B^2 / 2\mu_0} = \frac{(n_i + n_e)kT}{B^2 / 2\mu_0} \]

- The ratio of the plasma pressure to the magnetic field pressure
- A measure of the degree to which the magnetic field is holding a non-uniform plasma in equilibrium.
- In most magnetic configurations, fusion plasma confinement requires an imposed magnetic pressure significantly exceeding the particle kinetic pressure.

plasma pressure
magnetic Pressure (balloon tension)
Basic Tokamak Variables

• Concept of Beta

\[ \beta = \frac{2 \mu_0 p}{B^2} \]

- \( \beta \) is related with fusion reactor economics and technology.
- Maximum allowable value is set by MHD equilibrium requirements and instabilities driven by the pressure gradient.

Instability (bad curvature region) when with high \( p \)

www.waterrocket.com/goachaik-28.htm
the43sunsets.tistory.com/tag/코카콜라
Basic Tokamak Variables

• Concept of Beta

- Assuming that the magnetic surfaces have concentric, circular CXs and that conditions are independent of $\varphi$.

\[
\langle p \rangle = \int p dS / \int dS = \frac{2\pi}{\pi a^2} \int_0^a p(r) rdr
\]

\[
\nabla \times \mathbf{B} = \mu_0 \mathbf{j} \quad \text{Ampère’s law}
\]

\[
\frac{1}{r} \frac{\partial}{\partial r} (rB_\theta) = \mu_0 j_\varphi, \quad B_\theta = \frac{\mu_0}{r} \int_0^r j_\varphi (r') r' dr'
\]

\[
I_p = 2\pi \int_0^a j_\varphi rdr = 2\pi a B_{\alpha\iota} / \mu_0 \quad \beta_t = \frac{2\mu_0 \langle p \rangle}{B_\varphi^2}, \quad \beta_p = \frac{2\mu_0 \langle p \rangle}{B_{\alpha\iota}^2} = \frac{8\pi^2 a^2 \langle p \rangle}{\mu_0 I_p^2}
\]

\[
\beta = \frac{2\mu_0 \langle p \rangle}{B_\varphi^2 + B_{\alpha\iota}^2} \quad \frac{1}{\beta} = \frac{1}{\beta_t} + \frac{1}{\beta_p}
\]

- The power output for a given magnetic field and plasma assembly is proportional to the square of beta.

- In a reactor it should exceed 0.1: economic constraint
Basic Tokamak Variables

- Normalized beta – stability limit

\[ \beta_N = \beta_t \frac{aB_t}{I_p} \]

- Fundamental elements affecting the \( \beta_N \)-limit
  1. Current profile
  2. Pressure profile
  3. Plasma shape
  4. Stabilising wall
Basic Tokamak Variables

- Normalized beta – stability limit

\[ \beta_N = \beta_t \frac{aB_t}{I_p} \]

![Diagram showing normalized beta limit and some tokamak systems](image)
Basic Tokamak Variables

- How to achieve high beta?

- Providing high heating power and reducing loss by transport (sealing, insulation)
- If without reducing transport loss, transient high beta achievable with high heating power
Basic Tokamak Variables

- Plasma internal inductance

\[
l_i = \frac{L_i}{2\pi R_0} = \frac{2}{\mu_0 I_p^2 R_0} \int B_{\theta}^2(r) d^3V \quad L_i = \frac{1}{\mu_0 I_p^2} \int B_{\theta}^2(r) d^3V
\]

- For flat current density profile, circular cx

\[
J = J_0 \quad (r \leq a) \\
J = 0 \quad (a < r \leq b)
\]

\[
B_{\theta} = \frac{\mu_0 I_p r}{2\pi a^2} \quad (r \leq a) \\
B_{\theta} = \frac{\mu_0 I_p}{2\pi r} \quad (a < r \leq b)
\]

\[
B_{\theta} = \frac{\mu_0}{2\pi r} \int J 2\pi r dr \\
B_{\theta} = \frac{\mu_0 I_p}{2\pi a}
\]

\[
L_i = \frac{1}{\mu_0 I_p^2} \int B_{\theta}^2(r) 2\pi R_0 2\pi r dr
\]

\[
l_i = \frac{1}{2} - 2 \ln \frac{a}{b}
\]
**Basic Tokamak Variables**

- **Plasma internal inductance**

  - For Bennett current density profile, circular cx

  \[
  J = \frac{I_p a^2}{\pi (r^2 + a^2)^2} \quad (r \leq a)
  \]

  \[
  J = 0 \quad (a < r \leq b)
  \]

  \[
  B_\theta = \frac{\mu_0 I_p}{2\pi} \left( \frac{r}{r^2 + a^2} \right) \quad (r \leq a)
  \]

  \[
  B_\theta = \frac{\mu_0 I_p}{4\pi r} \quad (a < r \leq b)
  \]

  \[
  B_{\theta a} = \frac{\mu_0 I_p}{4\pi a}
  \]

  \[
  l_i = \frac{1}{2} \left( \ln \frac{4b}{a} - 1 \right)
  \]
Basic Tokamak Variables

• **Plasma internal inductance**
  - For more general current density profile, circular cx

\[
J = J(0) \left( 1 - \frac{r^2}{a^2} \right)^\nu \quad (r \leq a)
\]

\[
J = 0 \quad (a < r \leq b)
\]

\[
J(0) = \frac{I_p}{\pi a^2} \left( \nu + 1 \right)
\]

\[
B_\theta = \frac{\mu_0 J(0) a^2}{2(\nu + 1)r} \left( 1 - \left( 1 - \frac{r^2}{a^2} \right)^{\nu + 1} \right) \quad (r \leq a)
\]

\[
B_\theta = \frac{\mu_0 J(0) a^2}{2(\nu + 1)r} \quad (a < r \leq b)
\]

\[
l_i = ?
\]
