Water quality I

Today's lecture

- Sources of water pollutants
- Types of water pollutants
 - Oxygen demanding materials
 - Nutrients
 - Pathogens
 - Suspended solids & salts
 - Pesticides, pharmaceuticals and personal care products, endocrine disrupting chemicals, other organics
 - Arsenic & toxic metals
 - Heat & nanoparticles
- Oxygen demand: ThOD, COD, BOD

2

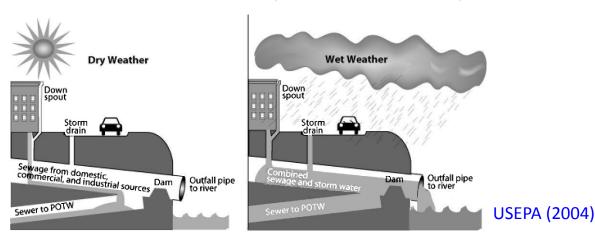

2

Sources of water pollutants

- Point sources: collected by a network of pipes of channels and conveyed to a single point of discharge
 - ex: domestic sewage, industrial wastewater
- Nonpoint sources: have multiple and diffuse discharge points
 - ex: urban and agricultural runoff

Combined sewer overflow (CSO)

- A nonpoint pollution problem
- Combined sewer system (←) separate sewer system)

- The sewage mixed with the storm water may go directly to the river
- Generally no longer constructed in the developed world, but old cities may still have the combined sewer

- Oxygen-demanding material
 - Any substances that can be oxidized in the water resulting in the consumption of dissolved molecular oxygen (DO)
 - Mostly biodegradable organic matter, but also includes inorganics (ex: ammonia)
 - Low DO poses a threat to fish and other higher forms of aquatic life that requires oxygen
 - Major source: human waste, food residue, industry (esp. food-processing & paper industries)

Nutrients

- Nitrogen & phosphorus
- Excessive nutrients → excessive algal growth
- Major source: agricultural runoff, human and animal excrement, P-based detergents, fertilizers, food-processing wastes
- Agricultural runoff may cause significant nutrient loadings to the water

Pathogens

- Bacteria, viruses, protozoa, and helminthes
- Excreted by diseased persons or animals
- Occurrence of pathogens in drinking water may cause outbreaks of gastrointestinal infections

1993 Milwaukee Cryptosporidiosis outbreak

The 1993 Milwaukee Cryptosporidiosis outbreak was a significant distribution of the Cryptosporidium protozoan in Milwaukee, Wisconsin, and the largest waterborne disease outbreak in documented United States history. The Howard Avenue Water Purification Plant was contaminated, and treated water showed turbidity levels well above normal. It was one of two water treatment plants for Milwaukee. The root cause of epidemic was never officially identified; initially it was suspected to be caused by the cattle genotype due to runoff from pastures. It was also thought that melting ice and snowmelt carrying Cryptosporidium may have entered the water treatment plants through Lake Michigan. MacKenzie et al. and the CDC showed that this outbreak was caused by Cryptosporidium oocysts that passed through the filtration system of one of the city's water-treatment plants, arising from a sewage treatment plant's outlet 2 miles upstream in Lake Michigan. This abnormal condition at the water purification plant lasted from March 23 through April 8, after which, the plant was shut down. Over the span of approximately two weeks, 403,000 of an estimated 1.61 million residents in the Milwaukee area (of which 880,000 were served by the malfunctioning treatment plant) became ill with the stomach cramps, fever, diarrhea and dehydration caused by the pathogen. At least 104 deaths have been attributed to this outbreak, mostly among the elderly and immunocompromised people, such as AIDS patients.

(Wikipedia, 2014)

2014-10-13

- Suspended solids (SS)
 - Particles carried by water
 - When the water flow slows down, most SS settle down, but colloidal particles do not settle readily
 - Cause turbidity in water and may destroy habitat for benthic organisms

2014-10-13

Salts

- Often measured as total dissolved solids (TDS): measure the weight remaining after evaporating a filtered water sample
- Evaporation of water from reservoirs, canals, and during application to plants increases salinity
- Increased salinity causes reduction in crop yield & threats to aquatic life

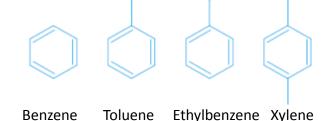

Pesticides

- Herbicides, insecticides, fungicides, ...
- Kills herbs, insects, fungi, ... → why not toxic to humans?
- Migrates to surface water by runoff; to groundwater by infiltration

- Pharmaceuticals and personal care products (PPCP)
 - Of recent interest
 - Substances used by humans and pets for health or cosmetic reasons and the products used to boost growth or health of livestock
 - Sources: human activity, residues from manufacturing, residues from hospitals, illegal drugs, drug use to animals (antibiotics and steroids)

- Endocrine disrupting chemicals (EDCs)
 - Compounds mimicking hormones
 - example: polychlorinated biphenyls (PCBs), atrazine, phthalates, bisphenol A (BPA), synthetic estrogen
 - May cause adverse effects at relatively low concentrations
 - Can interfere with the regulation of reproductive and developmental processes or alter the normal physiological function of the endocrine system

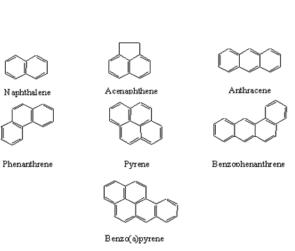

Other toxic organic chemicals

- BTEX
 - benzene, toluene, ethylbenzene, xylene
 - Spills from gasoline and other petroleum products
- Polycyclic aromatic hydrocarbons (PAHs)
 - Compounds with two or more fused benzene rings

• Incomplete combustion, petroleum

2014-2

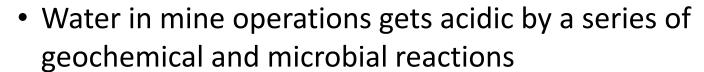

- Other toxic organic chemicals
 - Chlorinated ethenes and ethanes
 - Tetrachloroethane (PCE), trichloroethylene (TCE), tetrachloroethylene
 - Solvents for dry cleaning and metal washing

Arsenic

- Neither metal nor non-metal, but metalloid
- Source: mineral dissolution from weathered rocks and soils, mainly from iron oxides or sulfide minerals
- Human carcinogen
- Significant groundwater contaminant in many regions of the world (ex: 33-77 million of Bangladesh's 125 million people are at risk of As poisoning from groundwater)

- Toxic metals
 - Cadmium (Cd), Chromium (Cr), Copper (Cu), Nickel (Ni), Lead (Pb), Mercury (Hg)
 - Sources: industrial waste, wastewater treatment plants, stormwater runoff, mining operations, smokestack emissions, etc.
 - Some heavy metals bioaccumulate and biomagnify (ex: mercury in tuna)

- Toxic metals
 - Acid mine drainage (AMD)

- Generally metal solubility increases as pH lowers
- Water contamination ecosystem destruction, corrosion of infrastructure
- Outbreaks: recall from your middle school class!
 - Minamata, Japan mercury
 - Toyoma, Japan cadmium (itai-itai disease)

Heat

- Water used as coolants is discharged to the receiving waters
- May destroy the aquatic ecosystem
- Temperature increases → decrease in oxygen solubility → oxygen depletion in rivers

Nanoparticles

- Particles having a dimension < 100 nm</p>
- Naturally occurring humic material; TiO₂ particles in paints, varnishes, paper, plastics, creams, etc.; carbon nanoparticles in tires, tennis rackets, video screams, etc.; protein-based nanomaterials in the production of soaps, shampoos, and detergents
- Rapidly increasing production
- Toxicity and fate not well known

- Indicators needed to predict the extent of oxygen depletion and to maintain sufficient levels of DO in rivers and streams
- Theoretical oxygen demand (ThOD)
 - the amount of oxygen required to oxidize a substance to CO₂ and H₂O calculated by stoichiometry
 - The chemical composition of the substance should be known

Q: Compute the ThOD of 108.75 mg/L of glucose $(C_6H_{12}O_6)$.

- Chemical oxygen demand (COD)
 - A measured quantity does not depend on the knowledge of the chemical composition of the substances in the water
 - The organic compounds in a water is oxidized by a strong oxidizing agent such as potassium dichromate (K₂CrO₇) or potassium permanganate (KMnO₄)
 - The difference between the amount of oxidizing agent at the beginning and the end of the test is used to calculate COD

- Biochemical oxygen demand (BOD)
 - The oxygen demand is measured by a bioassay
 - The water sample is inoculated with bacteria that degrade organic matter in water
 - The difference in DO in the water sample at the beginning and end of the test is used to calculate
 BOD

ThOD ≥ COD > BOD

- Some organic compounds may not be oxidized even with a strong oxidizing agent (ThOD ≥ COD)
- Some carbon is used for bacterial growth; some organic compounds are not biodegradable; some organic matter is converted to non-biodegradable materials (COD > BOD)

Reading assignment

Textbook Ch 9 p. 378-392
