

# Air pollution I

# Today's lecture

---

- Units for air pollutants
- Air pollution problems
- Air pollutants
- Indoor air pollution
- Acid rain

# Today's goal

---

# Units of measurement

---

- volume/volume units (for gas phase pollutants)
  - ppm = parts per million
  - ppb = parts per billion
  - ppt = parts per trillion
- mass/volume (for gas & particle phase pollutants)
  - usually  $\mu\text{g}/\text{m}^3$

# Unit conversion

---

Consider a pollutant “i”

Ideal gas law:  $PV = nRT$

$$\frac{n_{air}}{V_{air}} = \frac{P_{air}}{RT} = \frac{mole_{air}}{m^3_{air}}$$

$R = \text{ideal gas constant} = 8.21 \times 10^{-5} \text{ m}^3\text{-atm/K-mole}$

$$ppm_i = \frac{\text{moles of pollutant } i}{\text{moles of air}} \times 10^6 = \frac{\mu mole_i}{mole_{air}}$$

$$\text{So, } \frac{\mu g_i}{m^3_{air}} = ppm_i \times MW_i \times \frac{P_{air}}{RT}$$

# Unit conversion

---

**Q:** Convert 10 ppb of SO<sub>2</sub> to μg/m<sup>3</sup> at 20°C, 1 atm.

# Air pollution problems

---

- Classification of air pollution problems
  - **Microscale:** less than the size of a house or slightly bigger
  - **Mesoscale:** a few hectares to the size of a city or slightly bigger
  - **Macroscale:** size of a county to a country and to the globe

# Air pollution problems

---

- Microscale air pollution problems
  - Indoor air pollution: pollutants from burners, ovens, heaters, cigarette smoke, and underground
  - Cigarette smoke on streets

<http://www.compacappliance.net>

<http://www.odamindia.org>

<http://www.edaily.co.kr>

# Air pollution problems

---

- Mesoscale air pollution problems
  - Vehicle exhaust
  - Smoke from power plants, factories, etc.
  - Smog

<http://web.ornl.gov>

<http://www.bbc.com>

# Air pollution problems

---

- Macroscale air pollution problems
  - Acid rain
  - Yellow dust
  - Ozone depletion
  - Global warming

<http://en.wikipedia.com>

<http://breitbart.com>

# Air pollutants

---

- Carbon monoxide (CO)
  - Generated by incomplete combustion of carbon
  - Natural sources: oxidation of methane (CH<sub>4</sub>) in the atmosphere
  - Anthropogenic sources: motor vehicles, fossil fuel burning, solid waste disposal, burning of plant materials
  - Carbon monoxide poisoning: lots of deaths in 1950s-1980s in Korea caused by indoor briquette burning

# Air pollutants

---

- Lead
  - Natural sources: volcanic activity and airborne soil
  - Anthropogenic sources: smelters and refining processes, and incineration of lead-containing wastes
  - In the past, lead used to be added to gasoline → significant air pollution problems → lead addition currently prohibited

# Air pollutants

---

- Nitrogen oxides
  - NO, NO<sub>2</sub>, N<sub>2</sub>O, NO<sub>3</sub>, N<sub>2</sub>O<sub>3</sub>, N<sub>2</sub>O<sub>4</sub>, N<sub>2</sub>O<sub>5</sub>
  - NO and NO<sub>2</sub> are involved in the formation of photochemical smog and acid rain
  - NO<sub>x</sub> = NO + NO<sub>2</sub>
  - Anthropogenic sources: combustion processes in motor vehicles, power plants, and the industry
  - N<sub>2</sub> is an inert gas, but reacts with oxygen at high temperature (>1600 K):

# Air pollutants

---

- Photochemical oxidants
  - Chemicals produced by reaction in the atmosphere in the presence of sunlight
  - Classified as secondary pollutants
  - Toxic effects because of their oxidizing ability: cause eye, nose, and throat irritation, and affect lung function
  - Major pollutants in photochemical smog
  - Most important photochemical oxidant: ozone

# Air pollutants

---

- Sulfur oxides
  - $\text{SO}_2$ ,  $\text{SO}_3$ ,  $\text{SO}_4^{2-}$
  - Called  $\text{SO}_x$
  - Sources
    - Direct emission of  $\text{SO}_x$  from power plants, industry, volcanoes, and the oceans
    - Oxidation of  $\text{H}_2\text{S}$  produced by natural biological processes or the industry
  - Involved in “London smog” and acid rain

# Air pollutants

---

- Particulates
  - Particles suspended in the air
  - Natural sources: sea salt, soil dust, volcanic particles, smoke from forest fires
  - Anthropogenic sources: fossil fuel burning, industrial processes
  - Damage respiratory organs

# Air pollutants

---

- Particulates
  - Large particles are trapped at the upper respiratory system, but small particles go deeper  
→ small particles are more significant!
  - Korean government regulate “PM<sub>10</sub>” and “PM<sub>2.5</sub>”
    - PM<sub>10</sub>: particulate matter less than 10 μm size
    - PM<sub>2.5</sub>: particulate matter less than 2.5 μm size

# Air pollutants

---

- Other hazardous air pollutants
  - Toxic organic compounds, heavy metals, arsenic, etc.
  - Korean government regulates 35 hazardous air pollutants
  - Some examples: cadmium, mercury, asbestos, dioxin, benzene

# Indoor air pollution

---

- Difficult to regulate!
- CO and NO<sub>x</sub> from gas ranges, ovens, heaters, and cigarette smoke
- Cigarette smoke also contains toxic compounds including carcinogens
- Bioaerosols: bacteria, viruses, fungi, mites, and pollen
- Radon: emitted from the ground (high in basements)
- Volatile organic compounds
  - ex) formaldehyde: emitted from building materials (“sick building syndrome”)
- Heavy metals: emitted from paints

# Acid rain

---

- $\text{SO}_2$  and  $\text{NO}_x$  in the air undergo series of reactions to form sulfuric acid ( $\text{H}_2\text{SO}_4$ ) and nitric acid ( $\text{HNO}_3$ )
- pH in natural rain has a pH near 5.6 (why?)
- Rain pH in polluted areas can go below 5, sometimes even close to 2
- Effects: acidification of rivers and lakes (fish deaths), nutrient leaching from soil (plant deaths)

# Reading assignment

---

Textbook Ch 12 p. 587-605
