

Chapter I. Introduction of Advanced Two-Phase Flow

1. Applications of Two-Phase Flow

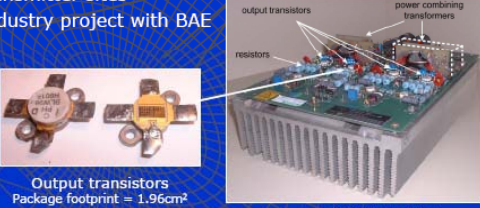

- power and propulsion system
- process system
- transport and transmission system
- environment control system
- information system
- biological system and devices
- geometeological phenomena

2. Characteristics of Two-Phase System

- . existence of moving and deformable interface
- . internal discontinuities of values
- . complicated flow fluid due to interfacial structure
- . mathematical difficulties for a local-instant formulation
- . difficulties in measurements and scaling problem

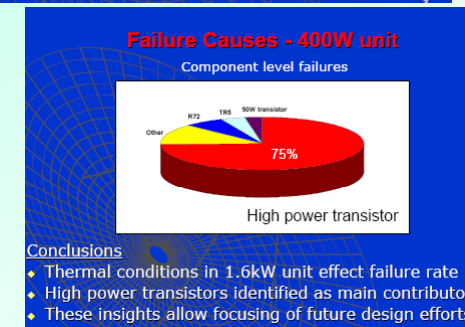

Problem Background

- High failure rate of 400W amplifiers
- Failure of 400W -> reliability of RADAR system compromised
- Possible thermal management issues within PCB
- Adverse climatic conditions (up to 50°C ambient) at transmitter sites
- Industry project with BAE

Output transistors
Package footprint = 1.96cm²

400W module

3. Methods of Two-Phase Analysis

- a) empirical correlations
- b) phenomenological models
- c) integral analysis
- d) differential analysis

4. Classifications of Two-Phase Flow

- o # of Phases ; solid, liquid, gas
- o composition ; water/steam, air/water, sodium/vapor
- o geometry ; upflow, downflow, horizontal
- o flow regime
 - . separated flow regime
 - . transitional flow regime
 - . dispersed flow regime

5. Two-Phase Problems in Power Industries

(1) Fossil plants

- ☞ boiler ; dryout
- ☞ condenser – heat transfer coefficient, Δp
 - flow distribution in inlet and outlet manifold
 - direct contact spray condenser

(2) Alternative energy sources

- ☞ OTEC(Ocean-Thermal Energy Conversion)
 - accurate knowledge of evaporating and condensing coefficient
- ☞ Geothermal energy
 - informations for Δp and void fraction
 - undesirable flow pattern
- ☞ Solar power plant – sodium heat transfer

(3) Nuclear power plants

- ☞ accident analysis like LOCA
 - nonequilibrium model to describe two-phase phenomena
 - interfacial phenomena between phases
- ☞ coolant behaviour in core and steam generator
- ☞ evaporation and condensation within horizontal tube

6. Key issues in two-phase flow

① treatment of gas-liquid interface

- ▶ worse than treatment of turbulence in single-phase flow
- ▶ interfacial area and interfacial drag or heat transfer

② prediction of local and average void fraction

- ▶ not cover all the flow directions and geometrical variations existing in a complex system

③ two-phase flow turbulence model

- ▶ interface-induced turbulence

④ three-dimensional and nonthermal equilibrium condition

- ▶ countercurrent flow in downcomer or small-break critical flow
- ▶ subcooled boiling, heat transfer beyond CHF or surface dryout, flashing during critical flow depressurization, direct contact condensation with and without gas
- ▶ empirical adjustment for mixing description among adjacent nodes

⑤ outside issues

- a) microchannel two-phase flow
 - b) global two-fluid problems
 - similarities between global climate and nuclear system
 - treatment of vertical movement of air with moisture
- atmosphere general circulation model

7. Multi-scale approach for nuclear thermal-hydraulic research

- o CFD scale
- o component scale
- o system scale

- macro-scale
- multi-field modeling
- transport of interfacial area
- turbulence modeling

(1) CFD scale

- open medium
- turbulence modelling using RANS or LES
- ITM(Interface Tracking Method) and DNS
- In bubbly flow,
 - o liquid turbulence by wall shear
 - o random stirring due to bubble motion
 - o vortex shedding in wake of bubble
 - o deformation of interface
 - ⇒ velocity fluctuation in liquid field

● Successive steps to investigate a two-phase flow with CFD

- Identification of important flow processes
- Selecting a basic model
- Filtering turbulent scales : RANS, LES
- Identification of local interface structures
- Use of Interface Tracking Method
- Selecting a turbulence modeling: k-ε, etc
- Modeling Interfacial transfers and validation
- Modeling Turbulent transfers and validation
- Modeling Wall transfers and validation

(2) Component scale

- design, safety and operation studies for reactor core, steam generator or pressurizer, etc
- minimum spatial resolution ; subchannel size (~ 1 cm)
- FLICA, COBRA, and THYC

(3) System scale

- RELAP or CATHARE
 - o two-fluid 6-eq. model
 - o 0D, 1D, 3D

Two-Phase Flow, A Science or An Art ?
