Electronics Cooling with Natural Convection and Radiation

- Introduction to ANSYS Fluent

Department of Innovative Design and Integrated Manufacturing Lab. Mechanical and Aerospace Engineering Seoul National University

Nov 7th 2017

Innovative Design and Integrated Manufacturing LAB.

1

- Example
 - In this example, analysis will be performed on heatsink heat dissipation which is generated from PCB (Printed Circuit Board).

Contents

- This example contains the following:
 - Heat conduction through solid material
 - Natural convection of hot air
 - Appropriate heat transfer
- In this class, we will skip meshing method.
- Objectives
 - Learn how to perform heat transfer analysis with CFD.

- In this example, air will be used as a medium.
- Radiation model and conduction/convection model is needed this "Heatsink" analysis.

Radiation Conduction Convection ε (Emissivity) н GAS T_1 T_2 Κ Coefficient (Convection heat σ (Stefan-Boltzmann (Thermal conductivity) Radiation transfer coefficient) constant) 2 modes Conduction or $\dot{q}_{\text{emit, max}} = \sigma T_s^4$ Velocity $T_{s} = 400 \text{ K}$ convection variation $= 1452 \text{ W/m}^2$ T_{∞} of air Temperature Blackbody ($\varepsilon = 1$) Air variation flow of air Diagram VACUUM T_2 T_1 Hot Block $\vdash \Delta x 0 \longrightarrow x$ 1 mode Radiation $\dot{Q}_{cond} = -kA \frac{dT}{dx}$ $\dot{Q}_{conv} = hA_s(T_s - T_{\infty})$ $\dot{Q}_{rad} = \varepsilon\sigma A_s (T_s^4 - T_{(surr)}^4)$ Equation HEAT TRANSFER, A Practical Approach, SECOND EDITION, YUNUS A. - Temperature unit change $K \rightarrow {}^{\circ}C$
 - 1. User-Defined \rightarrow Units
 - 2. Quantity \rightarrow Temperature
 - 3. Temperature units "°C"
 - Close
- Energy Equation activate
 - Tree \rightarrow Models \rightarrow Energy double click

Basic Model Setup

- Energy check (activate) \rightarrow ok

Introduction

• Comments on Model setup

- Check the mesh display, if there is any missing.
- Check the unit. Workbench uses SI-Units (meter, kg etc.)
- In many cases, on isothermal condition, we don't have to use energy equation because of CPU load. But in this case, we activate energy equation.

Material Properties

- Air density changes with thermal condition
 - 1. Materials \rightarrow Air \rightarrow Create/Edit
 - 2. Density \rightarrow Incompressible ideal gas
 - Other properties remain default
 - 3. Change/Create click
 - Create/Edit Materials close
- Add solid materials (Board, Heat Sink, Heat Source)

Manufacturing LAB.

- Put the PCB properties into the copper properties •
 - 1. Select "copper" \rightarrow PCB is consisted of "fr-4"
 - Change the name to "fr-4"
 - Delete chemical formula
 - 2. Density = $1250kg/m^3$, cp = $1300J/KG \cdot K$
 - conductivity $0.35 W/m \cdot K$
 - 3. Change/Create click
 - 4. To not overwrite to copper select "No"

Density = 1900 kg/m³, cp = 795 $I/kg \cdot K$, Thermal conductivity = 10 $W/m \cdot K$

• Comments on Material properties

- For natural convection problems, flow generate due to difference between density. In the simulation region we use incompressible ideal gas instead of compressible ideal gas because pressure change influence is minimal.
- Although fluent database have default property of materials, consisted of reference STP(0°C,1atm)/RTP(25°C,1atm) values, it needs to be checked before starting analysis.

Set Cell Zone Conditions

- 1. Cell Zone Conditions → Click "Operating Conditions" 2. Activate "Gravity" \rightarrow put y-direction gravity value " $-9.81m/s^2$ " 3. Activate "Specified Operating Density" and put 1.11 kg/m^3
- Click "OK"

- Adiabatic wall condition
 - 1. Boundary zone → select "wall_left"
 - Thermal tab → check "heat flux" 0
 - 2. Set the "wall_right" and "wall_top" same as above
- Select PCB's surface "adiabatic"
 - 3. Surface \rightarrow wall_board_bottom \rightarrow "Heat Flux" 0
 - Set the "wall_board_side" same as above
- Wall_board is PCB's fluid region not an outer boundary

Basic Model Setup

Solving

Introduction

Comments on Cell and Zone Conditions

- Operating conditions
 - For calculating the natural convection, gravity condition is needed. (But in many cases, gravity effect can be neglected.)
 - Operating density is very important in natural convection problem. We use density condition from the "Far Field Temperature" value. (Ex, Inlet temperature)
 - Operating pressure position is related to the inlet/outlet pressure condition.
- Boundary zones
 - Inlet and outlet pressure will be 0 Pa because it is on the operating pressure region.

Comments on Cell and Zone Conditions

- Volume data
 - On volume integrals panel, we can check the volume. However, before activating volume integral, initiation process is needed.

External heat loss

- In this problem, adiabatic condition of the outer wall is needed.
- When it is needed, we can modify the other FLUENT condition.
 - Heat flux condition
 - Heat transfer coefficient condition (Ex. Vertical planar natural convection)
 - Radiation heat transfer (emissivity and temperature, regardless of the radiation model in FLUENT)
 - Shell conduction (conduction analysis considering material and thickness)

Comments on Cell and Zone Conditions

- Internal boundary condition
 - 4 cell zones exist (2 fluid and 2 solid_board)
 - For dividing 2 zones we use pre-processing for making wall_board
 - To bring mesh, FLUENT makes shadow surface : wall_board_shadow
- Opening the two boundary condition
 - wall_board has the adjacent cell zone solid_board
 - wall_board_shadow has the adjacent cell zone fluid
- Check the surface if emissivity and wall roughness are applied correctly

Create a Monitoring Point

- We can monitor air temperature by generating a Point Surface near the upper component
 - 1. Postprocessing \rightarrow Surface \rightarrow Create \rightarrow Point
 - 2. Coordinates (in meters) put (0,0.15,0.05) and create
 - 3. Setting up domain \rightarrow Surface(Manage) \rightarrow Point (Position check)

Innovative Design and Integrated Manufacturing LAB.

• Surface Monitor

1. Ribbon tap \rightarrow Solving \rightarrow Reports \rightarrow Definitions \rightarrow New \rightarrow Volume Report \rightarrow Volume Average

Solving

- 2. On name, put "component-temp-mon" → on "Create" → check Report File and Report Plot
- 3. Report type \rightarrow Volume-Average
- 4. Variable → Temperature → Static Temperature
- 5. Cell Zones → select "solid_heatsource"
- 6. OK

Fluent can only monitor temperatures in Kelvin or Rankine. This applies only to the surface monitor and does not affect the units you have defined elsewhere.

間 _

• Solution

1. Run Calculation

- On pseudo transient options → "Fluid Time Scale", "Solid Time Scale" → user Specified
- Fluid 10s, Solid 1000s
- Now the preparation process is done.

Basic Model Setup

- It takes 5~10 minutes to converge.
- 2. Iteration : 150
- 3. Run Calculation

Introduction

• Comments on Solver Controls

- Solver setting is set for stable convergence.
- This basic model setup is needed for applying Natural Convection Pressure Scheme and Body Force Weighted.
- Solution initialization is used for initial iteration, and convergence speed will be faster if we put the value close to the converged value.

• Quick Post-processing

Manufacturing LAB.

1. Check total heat, mass balances

- Reports \rightarrow Fluxes \rightarrow Set Up
- Select the Inlet and Outlet, click compute
- Net Results will be displayed
- Check the value if it is low(it should be low)
- 2. Total Heat Transfer Rate \rightarrow choose all wall, Inlet, Outlet and then compute

°o

- 3. Check the difference with Energy Source(75W)
 - Difference between 75W and that one should be lower than < 5

• Quick Flow Visualization

- 1. Graphics \rightarrow Vectors \rightarrow Velocity(or Temperature)
- 2. Select all walls \rightarrow Save/Display

Summary

- From this example,
 - Conduction on solid is simulated.
 - Fluid and Solid conjugate heat transfer is considered.
 - Natural convection effect is simulated.
- Calculating the max. temperature is the main issue.
 - (Radiation effect can't be neglected. but, we skip the radiation process.)
- Before starting the analysis, we should clarify selection of the Mesh scale, Numerical method etc.
 - It can affect on Convergence speed, Stability.
