# **Bioreactor analysis & design I**

- Extended list of variables of interest with respect to reactor analysis & design
- Study on additional variables and analyses
  - Non-biodegradable VSS
  - (more in the next class)

#### CSTR, Monod: Master equations

Assumptions:

- Steady state
- $X_a = 0$  in the influent (negligible influent active biomass)

$$S = K \frac{1 + b\theta}{Y\hat{q}\theta - (1 + b\theta)}$$
$$X_a = Y \frac{S^0 - S}{1 + b\theta}$$

#### Bioreactor performance: Addt'l variables & analyses

- So far, we considered
  - Mass balance for S (of influent origin) and  $X_q$  only
    - S: soluble, biodegradable organics;  $X_a$ : active (living) biomass
- Although there should be
  - Particulate, biodegradable organics
    - influent origin, partially degraded in the reactor (rate slower than S)
    - contributes to effluent BOD, COD & VSS
  - Particulate, non-biodegradable organics
    - influent origin + generated in the reactor by cell decay
    - contributes to effluent COD & VSS (not BOD)
  - S of reactor origin
    - soluble, biodegradable organics produced by microorganisms
    - contributes to effluent BOD & COD

<Note> There should be soluble, non-biodegradable organics as well, but we can simply apply influent conc. = effluent conc.

## Addt'l variables & analyses (cont'd)

- For reactor design & operation, we also need to know
  - Nutrient balance: are there any limitation/redundancy in the influent nutrient supply?
    - Nutrient limiting substrate utilization will not occur as predicted; external nutrient supply may be needed
    - Nutrient redundancy significant level of residual N & P in effluent can be a concern (e.g., algal bloom)
  - e<sup>-</sup> acceptor balance: (usually for O<sub>2</sub>) how much should be supplied to support substrate utilization?

### Including non-biodegradable VSS

#### Recall:

$$\left(\frac{1}{X_a}\frac{dX_a}{dt}\right)_{inert} = -\frac{1}{X_a}\frac{dX_i}{dt} = -(1 - f_d)b$$

$$\stackrel{inert}{\longrightarrow} \frac{dX_i}{dt} = (1 - f_d)bX_a$$

### Including nbVSS: mass balance

Steady-state mass balance for X<sub>i</sub>:

$$0 = QX_i^0 - QX_i + (1 - f_d)bX_aV$$
$$\downarrow X_i = X_i^0 + (1 - f_d)bX_a\theta$$

## **Including nbVSS: solutions**

Solution for nbVSS: 
$$X_i = X_i^0 + X_a(1 - f_d)b\theta$$

Solution for total VSS:

$$X_{\nu} = X_i + X_a = X_i^{\ 0} + Y(S^0 - S) \frac{1 + (1 - f_d)b\theta}{1 + b\theta}$$
